PREFACE

THE present volume is designed for students who have not yet reached the point at which the special historical studies should properly begin. For advanced work specialization is of course indispensable, and historical "Outlines" are useful only in the early stages of the study or for purposes of general review. But within this limited sphere their functions are very important, since they not only supply the point of view which the student who specializes too early in his course is apt to neglect, but they aid the memory by affording a convenient nucleus for later acquisitions of knowledge.

In writing them as well as in using them it is necessary to remember that they are intended to be suggestive and not exhaustive, and that compression means the omission of some topics that seem equal in importance to others which have been included. The preparation of such a volume is in fact a problem in selection. A fairly complete chronological summary can perhaps be comprised within a single volume, but a general history which can be read without undue weariness and remembered without undue exertion must either overrun the space or limit its topics. The present "Outlines" have been prepared with this fact in mind, and while the writer has attempted to cover as wide a field as possible, he has chosen at some points rather to restrict his scope than to give a mere catalogue of events. For example, the history of the

United States has not been included, because, in the first place, it is more generally and more properly treated by itself, and, in the second place, so condensed a treatment as the limits of space allowed seemed of doubtful value. Again, the history of the non-Aryan peoples, especially since the beginning of the mediaeval period, has not received the attention that has been given to the races to which the leading nations of the world belong. As in most other general histories the chief object of attention in the chapters on mediaeval and modern history has been the European nations. In treating them, an effort has been made to trace their development so far as possible in a connected narrative, indicating the causal relations of events, for in the study of history nothing aids the memory so much as the perception of necessary sequences in historical facts. The narration of unrelated details, the enumeration of facts for their own sake, whether they lead anywhere or not, provokes in the student's mind a vague and unproductive wonder, which he is better off without; and it is to be hoped that the present work contains nothing that does not bear on its face the vindication of its usefulness.

It is thought that the first and most natural question that presents itself to a reader's mind is, "Of what use to me personally is the knowledge of this or that particular set of facts?" Much of the specialist's learning remains forever barred to the general reader merely for the former's unwillingness or inability to forestall this inquiry. In a brief general work the answer should be impressed on every page. At least such is the belief of the present writer, and by this means, rather than by what is termed picturesque writing or by very frequent recourse to the pretty story, this volume attempts to hold the reader's interest. Desiring above all

things to tell a plain tale simply, the writer has tried to abstain from the conventionalized historical ornamentation, and if those overworked metaphors, those dingy wax flowers of rhetoric, have found their way into these pages, they are there by accident and in spite of his good intentions.

As in all shorter works on history, the main value of this volume should consist in providing at once a general foundation for historical knowledge and a stimulus to further reading. If it does not fall short of these requirements, it will have fulfilled the purpose for which it was designed.

GENERAL HISTORY

CHAPTER I

INTRODUCTION

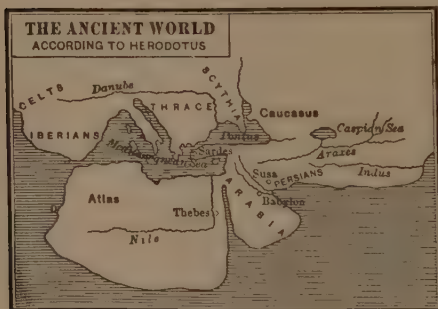

History defined. — History is the record of past events in the life of mankind. In detailing these events, however, it concerns itself with their relation, and seeks to point out the connection of cause and effect that exists between them. A bare catalogue of unrelated facts, though true in themselves, would not make history in the modern sense. There must be some definite principle on which the selection of the facts is based. This principle is that a fact, in order to have historical value, must help to explain what goes before or what comes after in the life of a people.

Kinds of History. — It is clear that the past life of mankind may be regarded from different points of view. Thus, if the special purpose is to show how men have advanced in knowledge from age to age, and what influences have quickened their minds or changed their modes of thought, the narrative is called Intellectual History. If the object is to point out the changes which have taken place in men's ideas of right and wrong, and to trace the development of moral standards, the work is termed a History of Morals. Political History deals with the external events in the life of a nation, showing its varying relations to other nations and to its own government. Constitutional History has to do with changes in the form and principles of government, and in the character and administration of law; Economic History, with the past conditions of a people in respect to the possession and acquisition of wealth.

So the particular field to which the narrative is confined determines how the history is to be classified. It is very difficult, however, to keep these departments distinct, as events which properly fall within the scope of one department have often a very important bearing on those which belong to another. A history which gives anything like a complete narrative of past events must investigate the facts pertaining to all sides of a nation's life.

Related Branches of Learning. — Correct description and explanation of past events requires a knowledge of certain classes of laws and facts which properly belong to branches of study distinct from history and yet closely connected with it. The most important of these are Geography, Ethnology, and Philology.

Geography. — It is evident that unless we knew in what part of the world a nation was situated, who its neighbors were, and what boundaries it possessed, we could not understand the

events which make up its history. We should have no definite idea of the meaning of the terms which historians employ. Thus the France and Germany of to-day differ widely in extent from the countries to which these names are ap-

plied in writing of the Middle Ages; and such terms as 'Burgundy,' 'Lotharingia,' and 'the Netherlands,' mean very different things at different periods of the history of those countries. Political Geography, therefore, dealing with successive changes in the boundaries of nations and principalities, is indispensable to the study of history.

Again, without a knowledge of the physical features of the country in which a nation lives, we cannot understand the

course of its history. The long and irregular coast line of Greece, with its numerous bays and harbors, and the subdivision of the country by mountain ranges throw light upon the seafaring tendencies of the Greeks and their lack of political unity. Many similar instances might be given showing the intimate relation between physical features and national life. Climate, too, is a factor of the greatest importance. There are marked differences, both mental and moral, between the peoples of hot regions and those living in cold or temperate climates. Physical Geography, accordingly, as explaining national character and conditions, is one of the most effective aids to historical knowledge.

Ethnology. — The science that traces the origin of nations and tribes, classifies and groups them, shows the kinship between them, and points out their characteristic customs and institutions, is termed Ethnology. The historian needs the aid of the ethnologist in determining the race and origin of the peoples he describes, and in making a correct picture of their manners and mode of life at certain periods of their history and even before recorded history begins.

Philology, or the science of language, helps to reveal the relationship of races, and aids the ethnologist in his classification. It also shows the influence which mutual contact has exerted on races, and gives an insight into the effects of conquest or fusion: as in the countries of southern Europe, where, after the Gothic invasion of the Roman Empire, the conquering Goths came to speak a language which was neither Latin nor Gothic, but combined certain elements of each; or again in England, where the effects of the Norman Conquest can be traced in the resulting language, the simple, homely words deviating but slightly from the Anglo-Saxon, while many of the more abstract terms, such as would be more likely to be used by the better educated or higher classes, were derived from the Norman-French spoken by the conquerors.

Uses of History. — It is a very common saying that we cannot understand the present without a knowledge of the past.

Past events are the signs by which we can in a measure forecast the future. It is only by the knowledge of the world's experience that the repetition of past mistakes can be avoided. We should neither value nor retain the benefits we have if we knew nothing of the struggle which it cost to obtain them. Civilization is a product of slow growth, and must be studied in all its stages if we would understand that stage in which we live and if we would put forth intelligent efforts for improvement.

Prehistoric Man. — As the term itself indicates, there was a period in the life of mankind when no historical record of events was kept. Savages grouped together in a clan or tribe, roaming over uncultivated lands, and subsisting by hunting or by fishing, have no history in the proper sense of the word. History does not begin till civilization begins, till men live as members of society, and the fanciful and superstitious tales handed down by tradition give place to written records showing some power of sifting the true from the false.

Yet in this dark, early period the researches of ethnologists have brought to light facts of the highest importance. In the

FLINT ARROWHEADS, AX, AND SAW

first place, it is interesting to learn that the earliest remains show no difference in physical characteristics between prehistoric man and the men of the present day. In the second place, that same law of development which is so manifest in the history of civilized man appears in the prehistoric period. Relics have been found showing successive stages in the progress toward

civilization. These stages are termed respectively the Stone Age, the Bronze Age, and the Iron Age, from the materials

out of which the primitive man constructed his implements of industry and war.

Stone Age. — The early part of the Stone Age is marked by the absence of any traces of human dwellings. Men lived in caves, and subsisted on the lower animals, but did not domesticate them. Their rude utensils made of stone, nevertheless, often show marks of considerable skill. Later in the Stone Age we see signs of a marked advance. Implements were more skillfully fashioned; and men were no longer cave dwellers, but lived in huts, some of which, as in the case of the lake dwellings in Switzerland, were well adapted for shelter and protection. There are evidences, too, that the people of the later Stone Age cultivated the fields, raising crops of wheat and barley.

Bronze and Iron Ages. — The Bronze Age shows a still greater advance in the arts of industry. Implements were made of copper, and often wrought into artistic shapes, and highly ornamented. In the last stage of the prehistoric period man had reached the Iron Age, in which implements were made of iron, as in the period of civilization.

BRONZE BATTLE-

AXE

It must not be thought that all races passed through these three stages at the same time. Some had reached the second while others had not passed the first. At the present time we find barbarous tribes still living in one of the earlier stages. Until comparatively recent times the North American Indians had not emerged from the Stone Age; and there are many tribes to-day, for example, the Aleuts (the inhabitants of the Aleutian Islands), who remain in that stage.

Classification of Races. — The division of races has puzzled scholars for centuries, and authorities even now disagree in points that are essential. The surest principle of classification is based on language, but the results must be tested by a study of the physical characteristics of the various races. According to this method of classification, the races of the

world may be divided as follows: Aryan, Semitic, Hamitic, Turanian, Negroid. The name Caucasian is generally applied to the first three divisions, — Aryans, Semites, and Hamites.

Aryan. — This includes the ancient Hindus (whose language was Sanskrit, the oldest and most similar to the original Aryan tongue), the Persians, Greeks, Italians, Celts, Teutons, and Slavs. Each of these races may in turn be divided into peoples which differ widely from one another in speech; yet the basis of the various languages is the same, and all are descendants of one original stock. The theory is that this parent tongue was spoken by the common forefathers of these races before successive migrations drew them from their original home; but where this ancient Aryan race lived is a matter of doubt, some scholars placing it in the plains of central Europe or on the slopes of the Caucasus, others adhering to the older theory that the cradle of the race was somewhere in Asia, probably in the region of the Oxus and Jaxartes rivers, north of the Hindu-Kush range of mountains. However this may be, it is believed that the original Aryans, before they began to scatter, had advanced far beyond the savage state. This appears from the evidence of language; for such words as 'God,' 'father,' 'mother,' 'cow,' 'ax,' 'home,' and the names of numerous implements of industry, are similar in the various languages of their descendants, indicating that before the division took place the original stock must have been acquainted with the ideas or things for which these words stand.

Semitic. — The Semitic race includes the Babylonians, Assyrians, Chaldeans, Syrians, Phoenicians, Hebrews, Ethiopians, and Arabs. The term 'Semitic' is derived from Shem, the son of Noah, and was originally applied to those peoples who are mentioned in Genesis as descended from Shem; but there is much difficulty in classifying them, because in the course of time, through conquest or intermingling, some peoples not of the Semitic race came to speak a Semitic tongue, while, on the other hand, pure-blooded Semites in some cases adopted the

non-Semitic language of their conquerors. The home of the original stock was northern Arabia.

Hamitic. — The Hamitic group has as its principal member the Egyptians or Copts; but, as in the case of the Semites, there is confusion in respect to the term, which was originally applied to the descendants of Noah's son Ham. By some the Ethiopians and Phoenicians are included in the Hamitic group.

Turanian. — The Turanian race embraces the Finns, Hungarians, Turks or Tartars, Mongols, and Malays.

Negroid. — This division includes the African Negroes, the Hottentots and Bushmen, the Melanesians, and the Negritos.

The Aryan Race. — As the object of history is to trace the progress of civilization, its chief concern is with those nations that have shown ability to advance in culture and enlightenment. The leading peoples in the world in this respect belong to the Aryan race. The great majority of Europeans and of European colonists and their descendants in all parts of the world are Aryans. The history of Greece and Rome, of France, Germany, Austria, Russia, Spain, Italy, the Scandinavian countries, the Netherlands, Great Britain, and the United States is a record of the doings of Aryan peoples.

Non-Aryan Races. — In the development of religions, the Semites hold the foremost place, for Christianity, Judaism, and Mohammedanism each had its rise among them. Nor is it to be denied that at certain periods of their history they have shown a high degree of civilization. Ancient Babylonia and Assyria at one time stood at the highest point of civilization that the world had yet attained; and as late as the eighth century A.D. a Semitic people, the Arabs, threatened to bring all Christendom under their control. Moreover, it must be noted that a Hamitic people, the Egyptians, was the earliest civilized nation of which we have historic records; and that a Turanian nation, the Hungarians, settled in the heart of Europe, has kept pace in civilization with its Aryan neighbors. Yet, as a rule, the non-Aryan races have not been progressive. They reach a certain point of civilization, and then

remain stationary or even retrograde, leaving to others to carry further what has been begun. For example, in the Dark Ages the Moors of Spain, a branch of the Semites, were the most enlightened people of Europe; but their intellectual energy declined, and it fell to the lot of Aryans to apply and improve upon what the Moors had taught.

Periods of History. — The division of history into periods is in one sense misleading, for the chain of events of which history treats is continuous, and there is no sharp line of division between them. But viewing certain periods of time as a whole, we find certain characteristics in one which are not present in another, and it is therefore convenient to separate them in our minds. The most general division is into Ancient and Modern: the former ending with the downfall of the Roman Empire in the West in 476 A.D., when the invasion of the Teutonic barbarians prepared the way for a new distribution of races and for the foundation of the states of modern Europe; the latter beginning with that date, and continuing to our own day. The more useful division, however, and that which will be followed in the present work, is threefold, as follows:

Ancient History, from the earliest times to 476 A.D.

Mediaeval History, or the history of the Middle Ages, the period between the downfall of the Roman Empire in the West (476 A.D.) and the time when European nations assumed to a great extent the character which they still retain. A convenient point to mark the end of this period is the fall of Constantinople, in 1453 A.D.

Modern History, from the fall of Constantinople in 1453 to our own times.

In treating of these periods it will be found convenient to divide each of them in turn into minor periods, according to certain characteristics which will appear later.

SYNOPSIS FOR REVIEW

DEFINITION OF HISTORY.

KINDS OF HISTORY: Intellectual History. History of Morals. Political History. Constitutional History. Economic History.

RELATED BRANCHES OF LEARNING: Geography. Ethnology. Philology.

USES OF HISTORY.

PREHISTORIC MAN: Stone Age. Bronze Age. Iron Age.

CLASSIFICATION OF RACES: Grand Divisions: Aryan, Semitic, Hamitic, Turanian, Negroid.

THE ARYAN RACE.

PERIODS OF HISTORY:

- I. Ancient—to 476 A.D.
- II. Mediaeval—476 A.D. to 1453 A.D.
- III. Modern—1453 A.D. to the present time.

ANCIENT HISTORY

CHAPTER II

ORIENTAL PEOPLES

Divisions of Ancient History.—Ancient history carries the narrative of events down to the year 476 A.D. In writing of this long period it will be convenient to separate it into two divisions: the first extending from the earliest time of which we have authentic records down to the early part of the fifth century B.C.; the second, from the latter date to 476 A.D. The reason for taking the early part of the fifth century B.C. as the dividing line is that before that time history deals with Oriental nations, while after it Greece and Rome are the central points of interest. In other words, the scene shifts from Africa and Asia to Europe when, in 492 B.C., Persia, the last of the ancient monarchies of southwestern Asia, enters on her great war with Greece.

Ancient Peoples of the East.—The ancient peoples of the East whose history falls within the first of these divisions are the Egyptians, Assyrians, Babylonians, Hebrews, Phoenicians, Persians, Chinese, and Hindus. The first of these, the Egyptians, would seem from their geographical position to belong to the Western group of nations, but in reality they have more in common with the Oriental peoples. Wars and commerce brought them into contact with the latter, and their civilization was essentially of the Asiatic type. What this type was, as distinguished from the form which Greece, Rome, and the other European nations assumed, will appear later. For the present it is enough to say that the ancient nations of Asia

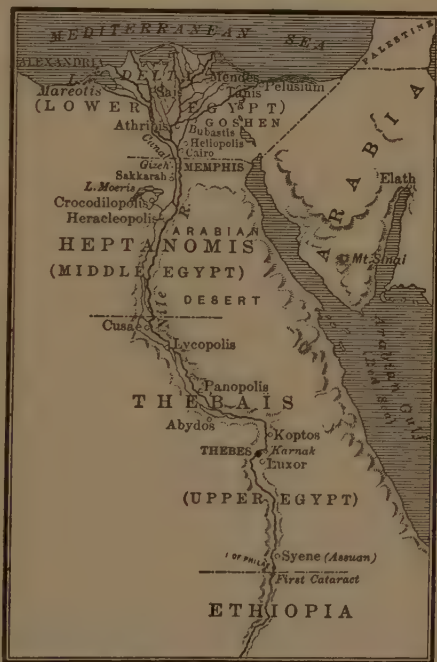

and Africa never advanced beyond a despotic form of government, in which the power of the ruler was absolute; and that their art, literature, and science, after reaching a certain stage of progress, remained stationary, while European nations showed a steady tendency to progress, both in forms of government and in learning.

Geographical Situation of the Earliest Civilized Nations.—The first nations to advance beyond the stage of barbarism were those which inhabited regions favorable to the production of wealth, either because of the fertility of the soil or on account of an advantageous situation in respect to trade. Egypt was nothing more than the fertile valley of the Nile. So in Asia the great kingdoms arose in the valleys of the Tigris and Euphrates rivers, and in the land watered by the Ganges, the Indus, the Hoang-Ho, the Yangtze Kiang, and their tributaries. Central Asia is a great plateau divided and bordered by chains of mountains. To the north are the plains of Siberia, stretching to the Arctic Ocean; on the east and south, mountain ranges separate it from the lowlands of China and India. Southwestern Asia, extending from the Indus River on the east to the Mediterranean Sea on the west, comprises the table-lands of Iran, the valleys of the Euphrates and Tigris, and the rich plains of Mesopotamia, the region between these rivers. West and south of the Euphrates lies the peninsula of Arabia, itself a plateau, but of lower elevation than that of Iran, and stretching from the Mediterranean Sea to the Indian Ocean, and from the Red Sea to the Persian Gulf. The barren plateau of central Asia has in all ages supported only a population of Mongols and Tartars, — nomad tribes which never advanced beyond the stage of barbarism. On the other hand, the lowlands and valleys on the east and south were the seats of the ancient civilizations of China and India; and in southwestern Asia, in the regions bordering on the Euphrates and Tigris rivers, and on the Caspian, Black, and Mediterranean Seas, the flourishing kingdoms of Assyria, Babylonia, Persia, Judea, and Phoenicia arose.

CHAPTER III

EGYPT

The Land.—Ancient Egypt was a narrow strip of country extending along both banks of the Nile, from the first cataract near the old city of Syene [*Si-ee'nee* ; modern Assuan'], northward to the mouth of the river in the Mediterranean Sea. The ancients gave it the name of Kem, or the Black Country, on account of its rich black soil, fertilized by deposits of mud left by the river, which every year overflows its banks. "Egypt," says the Greek historian Herod'otus, "is the gift of the Nile;" and this saying applies not only to the country itself, but to the character and customs of the people, for the whole history of the Egyptian people was determined by the natural features of the land in which they lived. Occupying the one fertile region in the midst of deserts, and having no neighbors except rude nomadic tribes, Egypt, during the greater part of her history,

was shut off from contact with any race that had reached a degree of civilization approaching her own.

The People. — Although the Egyptians are here classed as Hamitic, they are included by some in the Semitic race; in reality, their origin is unknown. They are thought to have come from Asia; but the earliest records that we have show them living in the valley of the Nile, and there is nothing to prove positively that they had ever lived elsewhere. Thousands of years before Greece or Rome became known to history, a peculiar race, of reddish brown color and smooth black hair, differing both in appearance and in language from the tribes around them, dwelt in the land of Egypt. At that early period they had most of the characteristics that marked their later history, and they had already reached a high degree of civilization. This is all that is known in regard to them when they first appeared in history. All else is mere supposition.

Sources of Information. — Man'etho, an Egyptian priest who lived in the third century B.C., prepared a list of the rulers of Egypt, dating from the earliest times. Unfortunately the original text of this list has been lost, but fragments of it have been preserved in the works of several ancient writers. These fragments of Manetho's list were the only important source for early Egyptian history till the nineteenth century, when the researches of European scholars led to the discovery of the art of reading the Egyptian manuscripts, and the inscriptions with which the ancient Egyptians were accustomed to adorn their monuments and other memorials of the dead. The information given by Herodotus, who visited Egypt in the fifth century B.C., is interesting but untrustworthy; for he seems to have believed, without questioning, all the stories that were told him, and to have repeated mere traveler's tales which are not supported by what we have gathered from other sources.

The Hieroglyphics. — We owe most of our knowledge of ancient Egypt to the inscriptions and manuscripts written in the characters called Hieroglyphics. This curious style of writing consisted of pictures or symbols representing words or letters.

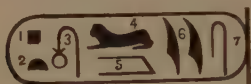

Thus, a circle stood for the sun, a crescent for the moon, an oval figure for the mouth, etc. As different pictures or signs were often used to represent the same word or sound, it is not strange that many centuries passed before scholars were able to decipher the hieroglyphic text. It was not till after 1795 that any clew to their meaning was discovered. In that year the finding of the Rosetta Stone gave the first key to the reading of hieroglyphics. On this stone the same inscription was given in three different sets of characters, — the hieroglyphics, the demotic text (a briefer and more running form of hieroglyphics, commonly used in the papyri or manuscripts), and the Greek. By comparing the letters in certain Greek proper names with the letters of the same words in the Egyptian texts, the sounds for which the Egyptian characters stood were discovered.

NOTE ON THE ROSETTA STONE. — The Greek text, when translated, showed that the inscription was an ordinance of the priests decreeing certain honors to Ptol'emy Epiph'anes on the occasion of his coronation, 196 B.C. (Ptolemy Epiphanes was one of a line of Greek sovereigns who ruled over Egypt from the time of its conquest by Alexander in the fourth century, to the first century B.C.) It contains a command that the decree should be inscribed in the sacred letters (hieroglyphics), the letters of the country (demotic), and Greek letters, — and this for the convenience of the mixed population of Egypt under its Greek rulers. It was natural to conclude that the three texts were the same in substance, and accordingly earnest efforts were made to decipher the hieroglyphics by aid of the Greek. The first clew was obtained by noticing that certain groups of the hieroglyphic characters were inclosed in oval rings, and that these groups corresponded in relative position with certain proper names, such as Ptolemy, etc., in the Greek text. The following line presents a few of the characters with a group in the oval ring. (Each word is read from *right to left*.)

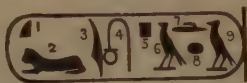

(Ptolemy eternal beloved of Phtah) of Egypt king of statue raising

It was by comparison of the group judged on strong grounds to be the name Ptolemy, with another group (found on another stone) supposed to stand for the name Cleopatra, that the first great advance was made. The groups were as follows:—

Supposed to be *Ptolemy*.

Supposed to be *Cleopatra*.

In Greek Ptolemy is *Ptolemaios*, and Cleopatra is *Kleopatra*. If now the hieroglyphic characters were *letter-signs*, the characters 1, 2, 3, 4, in Ptolemaios should correspond respectively with 5, 7, 4, 2, in Kleopatra (the *first* letter in Ptolemaios being the *fifth* in Kleopatra, etc.). In this way several letters were discovered; by means of other groups the whole alphabet was made out, and finally it was proved that by this phonetic alphabet the characters and groups could be resolved into the Coptic language of Egypt, which was already understood by scholars. It should not be forgotten that the great work of deciphering was mainly effected by the French savant, Champollion.

Antiquity of Egyptian Civilization. — Egypt is one of the oldest civilized nations of which we have record. Monuments and buildings, constructed with such skill that they have stood the wear and tear of thousands of years, bear witness to the fact that the people of this remote period were already far advanced in the arts of civilization. Just how far back to place the founding of the Egyptian kingdom we do not know; for scholars are not agreed, and between the earliest and the latest dates which they assign there is a difference of three thousand years. Some hold that Me'nes, the founder of the empire, lived as early as 5700 years before Christ, while others give his date as 2700 B.C. Most agree, however, in making it earlier than 3500 B.C., and recent researches have led historians to incline toward earlier dates.

Periods of Egyptian History. — The history of Egypt may be divided into three periods,—the Old Empire, to about 2100 B.C.; the Middle Empire, from 2100 B.C. to the expulsion of the Hyksos, or Shepherd Kings, about 1700 B.C.; the New

Empire, from 1700 B.C. to the conquest of Egypt by the Persians, in 525 B.C.

The Old Empire, to 2100 B.C. — The seat of the original empire was Lower (that is, northern) Egypt, and its capital was Memphis. Of Menes, the first of the kings, or Pharaohs, little is known. He is said to have been a warlike monarch and to have reigned for sixty-two years, after which he was eaten by a crocodile. The record of these remote times is by dynasties, or periods of rule by families, not by years, and it is not till the seventh century B.C. that the dates of events can be given.

THE GREAT PYRAMID AT GIZEH

Fourth Dynasty. — Not much has come down to us in regard to the first three dynasties, but the fourth was an era of great progress in literature and the industrial arts. To this period belongs the great Pyramid of Gîzeh [gee'zeh], near Memphis, till recent times the highest and largest building in the world, which, with the two smaller pyramids near it, still stands, after thousands of years, as an evidence of the marvelous skill and industry of the builders.

Art and Literature. — The art of this period, as exhibited in the engravings on monuments and tablets, reached a high degree of perfection, and in fact shows rather more skill in the imitation of nature than in later times. when a too rigid observance of established rules restricted the artist to a conventional or formal method of execution. The period of the fifth dynasty was also distinguished for the excellence of its artistic and literary works. During this time were produced the beautiful sculptures on the tomb of King Ti at Sakka'rah, illustrating events in the life of that monarch; and we have, too, the papyrus or manuscript of Ptah-Hotep, a royal official, who gives wise moral advice much in the style of the Book of Proverbs in the Old Testament: thus, "If thou art become great after thou hast been lowly and if thou hast heaped up riches after poverty, let not thy heart be puffed up because of thy riches, for it is God who has given them unto thee." To this period also belongs a portion of the Book of the Dead, the oldest book in existence, which recounts in mystical language the adventures of the soul after it has left the body, and tells how it can save itself by calling on the names of the gods.

Twelfth Dynasty. — From the close of the sixth to the beginning of the eleventh dynasty there is a gap in historical records, and at the end of this period we find that the capital has been transferred from Memphis to Thebes. The period of the new Theban rulers was rich in the productions of art and literature. Amenem'hat I., the founder of the twelfth dynasty, was a warlike prince, and under his successors the neighboring tribes were conquered, and the limits of the empire pushed farther south. User'tesen I. erected the obelisk of Heliop'olis, near Cairo. Another king of the same name conquered the Nubians; and Amenemhat III. built the famous reservoir called Lake Moeris, for receiving and distributing the waters of the Nile.

The Middle Empire, 2100 B.C. to about 1700 B.C. — The Theban kings, however, gradually lost power, and the fifteenth dynasty bears the name of the Hyksos, or Shepherd Kings. The period of the Middle Empire, therefore, was one of for-

eign rule. There is much dispute as to the race and origin of these Hyksos kings, but it is generally thought that they were a Semitic people. Although they adopted the names and style of native Egyptian kings, the country was restless under their rule; and so great was the hatred in which they were held, that when the Egyptians at last succeeded in placing a native monarch on the throne they destroyed almost every trace that could remind them of their oppressors. Accordingly, the records of the time are very scanty.

The Hyksos seem never to have fully subdued the people. In some parts of Egypt the country was in the hands of native governors; and it was the efforts of the last of the Hyksos to reduce the southern districts to complete subjection that led to a war of independence and the expulsion of the foreigners. A native prince rebels against the last of the Hyksos, and drives him from power; and after a long struggle we find the descendants of this successful patriot ruling securely on the throne of Menes.

The New Empire, from 1700 B.C. to the Conquest of Egypt by the Persians, in 525 B.C. — After the expulsion of the Hyksos, Egypt entered on a flourishing period. Aah'mes or Ama'sis I. was the first great ruler of the New Empire. Under him and his successors Egypt departed from her old conservative policy, and waged wars of conquest not only with her immediate neighbors, but with the countries of the East. She annexed the

OBELISK OF HELIOPOLIS

region now called the Soudan, subdued Palestine, overran western Asia, filled her treasury with the wealth of conquered provinces, and brought back thousands of captives to work on her great buildings. This was the period of the powerful sovereigns who bore the names Ameno'phis and Thothmes, and especially of Ramses II., called Sesostris by the Greeks, identified by many with the Pharaoh who oppressed the children of Israel. He won renown by his long wars with the Hittites, and even more by his works of peace, for he delighted in building great monuments and in having the story of his deeds inscribed upon them. A long epic poem, celebrating his exploits, was engraved upon the

RAMSES II.

SHRINE OF ABU SIMBEL

walls of many temples at Aby'dos, Karnak, Luxor, and other places. Temples were built in his honor at Memphis and

Thebes; and near Karnak stands the Ramesse'um, or House of Ramses, one of the famous buildings of antiquity. It was he, too, who built the rock-hewn shrine of Abu-Simbel, overlooking the Nile, with four huge statues guarding its entrance.

Decline of Egyptian Power. — The period between 1600 B.C. and the close of Ramses' reign in the fourteenth century B.C. marks the highest point of Egyptian power. Egypt was then the leading nation of the world, but under the successors of Ramses her power waned. The long wars had raised enemies on all sides, and at the same time created a military class, accustomed to live by the spoils of war instead of the arts of peace. Weakened internally, and beset by outside foes, she passed under the control of Ethiopian rulers, and at last went down before the rising power of Assyria. After regaining her independence for a short period, during which she enjoyed something of her old prosperity, she became tributary to Persia, whose king, Cambyses, defeated her army at Pelusium in 525 B.C. After this she never regained her power, but merely exchanged the rule of one foreign oppressor for that of another.

Egyptian Society. — The Greek accounts of Egypt show that the people were divided into distinct classes, of which the highest were the priests and the soldiers. Below these were the tillers of the soil, the artificers, and the herdsmen. But while particular rights were denied the lower classes, there was no such barrier between classes as existed in India. It was not required that a man should follow the profession of his fathers. Education was not generally diffused, but was confined for the most part

SOLDIERS OF THE BODY GUARD OF RAMSES II.

to the priests, who produced an extensive and varied literature, and knew something of the sciences. The warrior class

became especially important under the New Empire. The army comprised infantry, cavalry, and charioteers. The priests and soldiers alone could hold land in their own right. The common people seem to have been in the condition of serfs, obliged to work on the land of the nobles and the king.

Government. — The power of the king, though limited to some extent by the rights of the nobles, was still very great. The Pharaohs were, in fact, regarded as divine beings, descended from the gods.

Religion. — The gods of the Egyptians were very numerous, each locality paying especial homage to some particular deity.

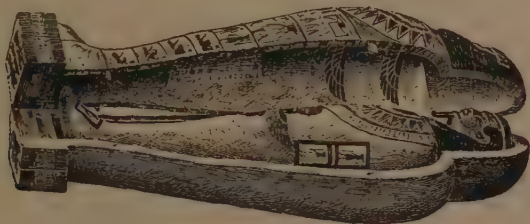

ANUBIS, THE GUIDE
OF THE DEAD

Yet there is evidence to show that, among the educated classes, there was a belief in a single god, all the other divinities being regarded as mere symbols of the divine power in its various aspects. Chief among the deities were Osiris and his sister Isis, who were worshiped by all Egyptians. Osiris was the chief sun god; Horus, his son, the god of the new or rising sun; and they were regarded as the adversaries of the gods of darkness who wielded the power that made for evil.

Animal Worship. — A peculiar feature of the Egyptian religion was the worship of animals. The bull Apis was worshiped as a god at Memphis; and many other animals, such as the ibis, the cow, the crocodile, the cat, etc., were sacred to particular gods. The greatest reverence was shown for these animals, which were kept in the temples and most carefully tended.

Burial. — Another striking religious custom was the embalming of the dead. It was thought that the soul would reanimate the body at the resurrection, and for this reason great care was taken to preserve the body from decay and provide it with a suitable resting place. Embalming was so skillfully and effectively done that decay was often prevented for thousands of years. The interior of the sepulcher was often decorated, and

food and drink were placed beside the body. These houses of the dead were among the finest and the most enduring of Egyptian buildings.

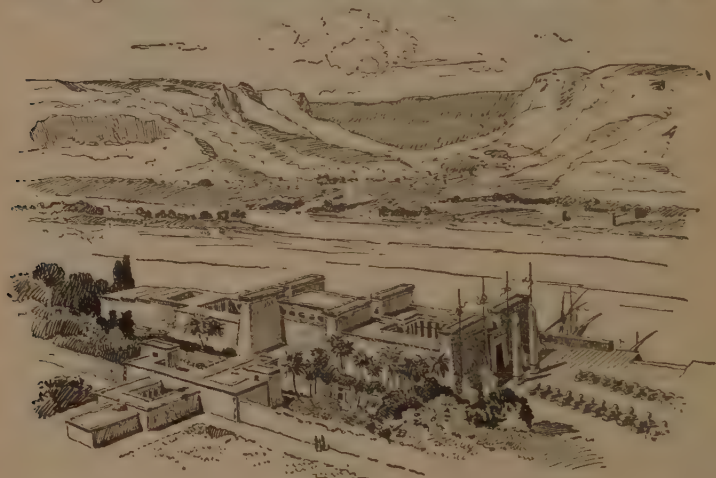

MUMMY

Architecture. — Some of the most famous examples of Egyptian architecture have already been mentioned. In their talent for building and in the vast wealth and labor expended on public works, the Egyptians surpassed all the other ancient nations. The characteristics of their buildings and monuments were their massiveness and great size. Huge blocks of stones were moved long distances, to form the roofs of temples or the walls of pyramids. In the absence of modern appliances, the labor and time involved can scarcely be estimated.

The chief sculptural figure was the sphinx; a symbolical statue, often of colossal size, having the head of a human being or an animal, and the body of a lion with wings attached. The most noted of these is that still standing near Gizeh.

Another remarkable feature of Egyptian architecture was the pyramid, a huge pointed structure of stone, designed as a royal sepulcher. The pyramids are very numerous, the most famous being the Great Pyramid, also at Gizeh. It was the tomb of the ancient king Khu'fu or Cheops [Ke'ops], and is said to have measured nearly 481 feet in height with a base 764 feet square, but it has been stripped of many of its stones for the building of the neighboring city of Cairo. The palaces and temples were of enormous size, and the way to them was often lined by rows of gigantic pillars, sphinxes, or obelisks.

Egyptian Arts. — The walls of temples and other structures were often highly ornamented, with figures suggested by the forms of Egyptian vegetation, such as the palm, the lotus flower, and papyrus. These sculptures often show great artistic skill, but the art of the Egyptians was not progressive, and the designs were conventional. Rules and traditions, rather

AN EGYPTIAN TEMPLE

than the study of nature, governed the artist in his work. Bright colors were employed in decoration, but in painting, also, Egyptian art was stationary.

Musical instruments of many kinds were known and used, and it is probable that the Egyptians were skilled in their use. Music accompanied the dance, and formed a part of religious ceremonies.

In the practical arts, such as glass making, metal working, the engraving of gems, and the manufacture of linen, they were very skillful. From the papyrus, a reed that formerly grew in abundance in northern Egypt, they made, by an ingenious process, sheets of a paper-like substance which was used for writing. Rolls made of this material were the books

of the Egyptians, from whom in later times the Greeks and Romans learned the art of preparing the papyrus.

Agriculture and Commerce.—The people were mainly agricultural, but employed rude methods of cultivation. In spite of this, the remarkably fertile soil yielded an abundance of produce, and Egypt was known as the granary of the world.

EGYPTIANS SOWING

The Egyptians were not an adventurous people, and they did not give much attention to maritime enterprise. The foreign trade finally passed to the Phoenicians.

SYNOPSIS FOR REVIEW

ANCIENT HISTORY. CHIEF ANCIENT PEOPLES OF THE EAST: Egyptians; Assyrians; Babylonians; Hindus; Hebrews; Phoenicians; Persians.

GEOGRAPHICAL SITUATION.

DIVISIONS OF ANCIENT HISTORY:

- I. To the close of the fifth century B.C.
- II. From the close of the fifth century B.C. to 476 A.D.

PERIODS OF EGYPTIAN HISTORY:

- I. The Old Empire, from 3500 (?) B.C. to 2100 B.C.
- II. The Middle Empire, from 2100 B.C. to 1700 B.C.
- III. The New Empire, from 1700 B.C. to 525 B.C.

THE OLD EMPIRE, 3500 (?) B.C. TO 2100 B.C.: Menes the founder. The fourth dynasty. The fifth dynasty. The Theban kings.

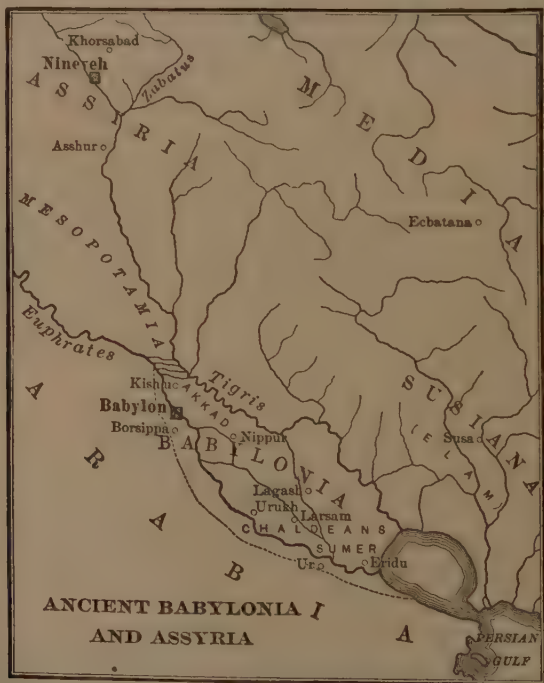

THE MIDDLE EMPIRE, 2100 B.C. TO 1700 B.C.: Egypt under the Hyksos. Expulsion of the Hyksos.

THE NEW EMPIRE, 1700 B.C. TO 525 B.C.: Conquests under Amasis and his successors. Ramses II. Decline of Egyptian power. Conquest by Cambyeses, 525 B.C.

CHAPTER IV

BABYLONIANS AND ASSYRIANS

Geography.—The Babylonians and the Assyrians lived in the region of the Tigris and Euphrates rivers, in southwestern

Asia. The former occupied the fertile district to the south of the point where these two rivers approach closely to each other, while the higher and more mountainous tract to the

north was the dwelling place of the Assyrians. It was natural that the fertile lowlands should support the larger population and produce the earlier civilization, and the Babylonians had become a numerous and civilized people long before their neighbors and kinsmen to the north are heard of in history. In fact, these alluvial valleys of the two great rivers, and the district adjoining the Persian Gulf, were the starting point of the civilization of western Asia. Wheat, barley, and many kinds of fruit grew wild, and the efforts of the cultivator were rewarded by rich harvests. Besides the natural means of communication afforded by the rivers, the country was provided with a vast system of canals.

The Race. — Before scholars had learned how to decipher the cuneiform (wedge-shaped) inscriptions of the Babylonians and Assyrians, the details of their history were scanty, being mostly confined to the writings of Herodotus, the Greek

ilu Nabu- kudurri-uzur
THE NAME NEBUCHADNEZZAR IN CUNEIFORM

historian, and of Bero'sus, a Babylonian priest. The reading of the cuneiform texts, however, brought to light a great number of interesting and important facts, many of them described nearly at the time of their occurrence. The Babylonians and Assyrians were two divisions of the same race. The primitive ancestors of both seem to have belonged to the Turanian family, that which includes the modern Turks and Chinese; but at an early date large numbers of Semites, probably from Arabia, settled in the country, and, mingling with the natives, in the course of time gave the race a distinctively Semitic character. This change, however, was less pronounced among the Assyrians of the north than among the Babylonians, whose country was more inviting to immigrants.

The Legendary Period. — Babylonian writers filled up the centuries that precede the period at which their genuine history begins with a mass of legends. They reckoned that 432,000 years elapsed before the Deluge, and this time was

said to have been taken up with the reigns of ten kings. From the Deluge down to the time when Babylonia fell under the power of the Persians was a period of 36,000 years. Their story of the Deluge is almost the same as the account given in the Bible. Their Noah was Xisu'thros, who with his family and friends survived the flood, the rest of the human race being drowned for their sins. Like Noah, he built an ark, and stocked it with all kinds of animals; and the ark was stranded on a mountain top. The biblical account of the Tower of Babel appears with hardly any variation in the early Babylonian records. Many of their stories also bear a marked resemblance to Greek myths, and, like the latter, were gathered in a great epic poem said to have been written 2000 years before Christ, and kept in the library of the city of Uruk.

Early Babylonian History. — The land of the Babylonians was divided into the two regions Akkad, in the north, and Sumer or Shinar, in the south. To the west of the Euphrates the land was termed Edinna, and has been identified by some with the Eden of Genesis. The term Chaldea is sometimes applied to Babylonia, but is more properly confined to the low portion, bordering on the Persian Gulf; and the Chaldeans, who dwelt there, are not heard of in history till the ninth century B.C.

The biblical account makes Nimrod the ancestor and founder of the Babylonians. Their early history is very obscure and confused. We hear of a great king named Lig-Bagas or Ur-Bagas, who ruled over both Akkad and Sumer, and built enormous structures of sun-dried bricks, one of which (200 feet square and 100 feet high) is estimated to have contained 30,000,000 bricks.

Sargon. — But a greater name is that of Sargon, famous as a lawgiver, a conqueror, and a patron of learning. He made campaigns against Syria and Palestine, and carried the Babylonian culture to the shores of the Mediterranean. That culture was already extensive. A great mass of astronomical and astrological learning was collected for Sargon by the scholars

of his court, and gathered into seventy-two books, which were afterwards translated into Greek. The exact date of his reign cannot be ascertained, but the antiquity of Babylonian civilization is thought to surpass that of the Egyptian. One chronicler places the reign of Sargon's son and successor at 3750 B.C. The Babylonian monarchy, however, was weakened by disunion. The greatest of its kings could hold the kingdom together for only a short time. Sargon himself could not bring the land of Sumer under his control. This weakness invited invasion; and a foreign dynasty, the Cassite or Cos-sae'an, probably of Arabic origin, ruled the country for several centuries.

Assyrians. — While the Cassites were ruling in Babylon, the princes of Assyria were gradually building up a powerful kingdom. After a while they became strong enough to treat on equal terms with Babylonia, and finally, a war arising, marched into the kingdom and captured Babylon (1270 B.C.). Thenceforth the Assyrians were the dominant people. For a time Babylonia kept its independence, but finally fell under the power of its more warlike neighbor. The Assyrian king Tig'lath-Pile'ser I. gave the finishing blow to the old Babylonian monarchy; and he extended his conquests in other directions, even, it is said, into Kurdistan' and to the shores of the Mediterranean.

Then followed a period in which the Assyrian power waned and the Babylonians regained their independence. Later, however, a succession of strong Assyrian rulers not only made themselves supreme in Babylonia, but overran Armenia, Cilicia, Mesopotamia, and other countries of Asia Minor, and made the Phoenicians on the Mediterranean coast pay tribute. One of the greatest of these princes was Shalmane'ser II., who reigned in the middle of the ninth century B.C. He was constantly engaged in war, defeated a confederation of western princes, of whom Ahab, King of Israel, was one, and humbled the power of Syria. Under him the First Assyrian Empire reached its height. It was the greatest power in west-

ern Asia; but, though its conquests were extensive, it did not hold the conquered lands under its sway. It knew how to win victories, but it did not organize the conquered lands and make them a part of its empire.

The Second Assyrian Empire. — With the accession of Tiglath-Pileser II. in 745 B.C. a new period begins, that of the Second Assyrian Empire, which differed from the first in its policy of consolidating the conquered provinces under its own rule. Tiglath-Pileser II. was not content with exacting tribute from his conquered enemies. He placed Assyrian governors over them, and turned their lands into provinces of his empire. He died in 727 B.C.; and five years later another great conquering prince, who had assumed the name of the old Babylonian Sargon, came to the throne. Sargon conquered all his enemies in Asia, including Hittites, Jews, Phoenicians, and Syrians. Babylonia having won her independence, he conquered her again, and had himself crowned king in Babylon. All western Asia was fused into an Assyrian empire. The only dangerous rival was Egypt, whose conquest he left for his successors to complete, though he had defeated an Egyptian army in 720 B.C.

Sennacherib. — Sennach'erib (705–681 B.C.) managed to hold the empire together; but though his inscriptions boast of great conquests, he seems not to have been always successful. He tried to capture Jerusalem, and failed. He is famous as a builder of canals and aqueducts, and of a huge palace at Nineveh. Under his successor, Esar-haddon (681–669 B.C.), the Second Empire reached the summit of its power. This monarch conquered Egypt on the south, and in the north penetrated into the little-known region of Media.

Sardanapalus. — The last great Assyrian king was Assurbani-pal, known to the Greeks as Sardanap'alus. He was a magnificent and luxurious prince, famous rather as a patron of literature and art than as a warrior. Under him the empire reached its widest extent, but decay had already set in. Serious revolts broke out in Babylonia and other parts of his

dominions, and were put down with the greatest difficulty. The empire lasted only a few years after his death. Babylonia again became independent, in 625 B.C., and soon afterwards the Medes and their allies captured Nineveh and overthrew the Assyrian kingdom. Assyria was then shared between Media and Babylonia.

The Second Babylonian Empire. — For a time Babylonia regained something of its ancient greatness. Nebuchadnezzar brought the empire to the height of its fame. Among his warlike deeds were his defeat of the Egyptians, whom he compelled to give up Syria, and the capture of Jerusalem, which resulted in the carrying away of the Jewish families of the upper class into captivity at Babylon.

ASSYRIAN PALACE AT NINEVEH

The city of Babylon, under Nebuchadnezzar, was enlarged and improved. For wealth, luxury, and the magnificence of its buildings, it was unequalled. No ancient city can be compared to it in size. Its walls are said to have measured forty miles in circumference, and seventy or eighty feet in height. The famous 'hanging gardens,' which were terraces made in imitation of mountain scenery, were constructed by Nebuchadnezzar to please his Median queen. Another famous structure was the temple of Bel or Baal, which was roofed with cedar overlaid with gold.

Fall of the Kingdom. — Nebuchadnezzar died in 562 B.C.,

after a reign of about forty-two years; and with him perished the Babylonian kingdom, for his successors lacked the vigor to withstand the attacks of a new power that had appeared in Asia Minor; namely, the Persian monarchy. Under the leadership of Cyrus the Great, the Persians had gained dominion over the Medes, and begun a career of conquest. The story of the capture and destruction of Babylon is told in the Bible. The last king was Naboni'dus, who was ruling in connection with Belshaz'zar.

Babylonian and Assyrian Civilizations. — In science, particularly in astronomy, the early Babylonians surpassed the Egyptians. As they were worshipers of natural objects, especially of the heavenly bodies, it was not strange that they made careful astronomical observations. It is said that Alexander the Great found these observations extending for an unbroken period of 1903 years. The Babylonians divided the year into twelve months, the week into seven days, the day (from sunrise to sunset) into twelve hours, and the hour into sixty minutes. From the Babylonians came the knowledge of weights and measures to the Western nations.

Architecture and Sculpture. — In architecture they did wonderful work, constructing huge buildings from the rude materials which they had at hand. They knew the art of coloring, and many of their sculptures were brilliantly colored. Therein they differed from the Assyrians, whose work shows no regard for bright colors. Both the Babylonians and the Assyrians showed extraordinary skill in sculpture, especially in their bas-reliefs; and while the figures are generally not lifelike, there is a certain simplicity and vigor especially in the drawing of animal figures. Other arts also flourished, as the cutting of gems, dyeing, weaving, and embroidering. The Babylonians were noted for their luxury.

Religion. — Their religion was like that of the Phoenicians. Baal was their god, who was identified especially with the sun, the giver of life and light to his adorers, and of fierce heat to those who failed to do him honor. With him was associated

Baaltis, a female divinity, the goddess of the fertile earth. Besides, there were gods of the sky, of the moon, of the waters, of love, etc. Ish'tar or Ash'toreth was the goddess of war and love. The Assyrians had the same religion as the Babylonians, but the god Ass'ur was the guardian deity of their country. They were much more savage than the Babylonians, lacked their literary skill, but showed a greater aptitude for trade. During their flourishing days Nineveh was the greatest commercial city in the world.

CHAPTER V

THE HEBREWS

Introduction. — The mission of the Jews was to found a religion which should influence the entire world. Their history is the history of the development of that religion, and its survival in the midst of dangers and hostile influences, and in spite of the occasional backslidings of the Jews themselves. The de-

tails of the subject are of such interest and importance that they make up a special field of study by themselves. They belong to the department of Sacred History, and can not be treated fully in the present work. It is possible to give here only some of the leading facts in Jewish history, especially such as show their relations to other ancient races.

The Race. — The Jews belonged to the Semitic race, and consequently were closely allied to the Phoenicians, Assyrians, Babylonians, and Arabs. They traced their descent from Abraham, who left his native place of Ur, on the Euphrates River, and came into the "promised land" of Canaan, which was on the west-

ern side of Syria, south of Phoenicia. There he wandered with his herds, and founded a family. According to the biblical narrative, one of his descendants, Joseph, was sold into slavery, and carried away into Egypt, where he won the favor of the Egyptian king or Pharaoh, who permitted Joseph and his family to settle in the land of Goshen, in northern Egypt. Here, in the pasture lands of Goshen, they lived as herdsmen, till there came to the Egyptian throne a new line of rulers, who, being jealous of the growing numbers and prosperity of the Hebrews, began to oppress them. The Book of Exodus tells how a great leader, Moses, arose to rescue them from the land of bondage, how he communed with God

on Mount Horeb, and how he led his people through the Red Sea, miraculously parted by "a strong east wind." The exodus (or flight) of the Jews from Egypt is placed by chronologists at about 1300 B.C.

The Era of the Judges. — From the exodus (about 1300 B.C.), for a period of two hundred years, the Hebrews were governed by men who did not call themselves kings, but exercised their authority by common consent as possessed of a divine right. It was a period of struggle; for, after forty years of wandering in the wilderness, the Jews found that the land of Canaan, to which they had returned, was in the hands of powerful foes, who could be dislodged only by hard fighting. Philistines, Moabites, Midianites, and Ammonites, all had to be exterminated; but great leaders, like Gideon, Jephtha, and Samson arose to do the work. The last of the rulers in this period was the prophet Samuel, who reformed the state and stirred the courage of the Jews against their enemies.

The Era of the Monarchy. — The people now insisted on having a king. They wished a more compact administration as likely to make the state stronger and more successful in war. The kingdom continued undivided during the reigns of Saul, David, and Solomon (that is, from about 1090 to 975 B.C.), and during these early years it reached the height of its glory; but after Solomon's death the kingdom was divided, and never regained its former power. Saul was the first king. His reign was full of conflicts, and embittered by his envy at the growing popularity of David. Saul's death brought David to the throne; and then followed the period of Israel's greatest power, for David extended his rule over the hostile tribes in the vicinity, and even as far as the Euphrates and the Red Sea. He made Jerusalem his capital. He was by far the greatest of the kings, and he raised the Jewish state to a position of international importance, so that it seemed almost as if his people were to have a great political destiny as well as a religious mission.

Solomon's Reign, about 1015-975 B.C. — This was the most

splendid period in Jewish history. The magnificence of Solomon is proverbial. The kingdom which David had built up, Solomon brought to its highest power. He secured himself by alliances with Syria, Egypt, and Tyre. Hiram, the king of Tyre, was a fast friend of Solomon, as he had been of David, and the result of this alliance was greatly to advance the commerce of the Jews in the Mediterranean and on the Red Sea. Tyrian sailors were often employed on Jewish vessels. By the acquisition of a port at the head of the Gulf of Elath the way for commerce was opened to the Indian Ocean. Jerusalem became a beautiful city, with a new wall, a magnificent palace, and, greatest of all, the famous Temple which Solomon built on Mount Moriah.

Yet the reign has its dark side. Solomon, whose wisdom is even more famous than his wealth, nevertheless managed to do his country a great deal of harm. He was a perfect type of the all-powerful Eastern ruler, — luxurious, lavish, careless of the real welfare of his people. Heavy taxes were required to keep up the splendor of his court, and the resources of the state were exhausted. What was worse, the old strict exclusiveness, that had kept the faith of the Jews pure, was broken down, and religion was corrupted. He allowed the heathen to practice idolatry in his kingdom, and even took part in heathen rites himself.

The Divided Kingdom. — This dark side of the reign of Solomon was made apparent by the events that followed his death. Revolt had broken out against him, and had been put down; but his successor, Rehoboam, was less fortunate. The ten tribes north of Judah cut themselves loose, and set up an independent kingdom, known as the kingdom of Israel, with the capital at Samaria. The remaining tribes constituted the kingdom of Judah, with its capital at Jerusalem. The two kingdoms

SEVEN-BRANCHED CANDLE-
STICK FROM THE TEMPLE

Relief on the Arch of Titus
at Rome

continued separate until the downfall of both, which might not have occurred if they had remained united against their

foes. In both Israel and Judah this was a period of decline. The kings made alliances with the heathen, and permitted idolatry, in spite of the warnings of the prophets. Israel was the first to fall. Sargon, the Assyrian king, captured Samaria, and carried off the inhabitants as captives, in 722 B.C., repopling the country with his own subjects. The Israelites never returned, and what became of them is a matter of conjecture. Judah lasted for more than a century afterwards, till 586 B.C. In that year Nebuchad-

HIGH PRIEST

nezzar, King of Babylonia, took Jerusalem, and bore the people away to Babylon, where they remained in exile during many years. The period of the Babylonian captivity closed when Cyrus the Great, having conquered Babylonia, 538 B.C., gave the Jews permission to return to their homes.

Later History. — From the time of the Babylonian captivity the Jews ceased to exist as an independent nation. They were ruled successively by the Persians, the Syrian successors of Alexander the Great, the Ptol'emies of Egypt, and the Romans; and though there was a brief interval of freedom, when they rose in successful revolt under the Maccabees against the Syrian rulers, their history is merged in that of other races.

Summary. — The Jews did not develop a great national state. They were not great conquerors, and never approached the political power of the empires of Egypt, Assyria, Babylonia, and Persia. Nor did they add much to the world's knowledge of art or science. Their mission was to spread a higher form of religion than any other race had developed. Their whole history seems to tend in this direction. Had they conquered

and annexed other lands, they would have felt to a greater degree the influence of other religions. Political ambitions, stimulated by success, might have distracted them from their single purpose of keeping their faith pure. On the other hand, defeat and tyranny never made them abandon it.

CHAPTER VI

THE PHOENICIANS

Land and People. — The name Phoenicia is derived from a Greek word meaning 'palm,' and signifies 'the land of the palm.' It consisted of a narrow strip of fertile territory on the eastern coast of the Mediterranean, between the Lebanon Mountains and the sea. It was about 150 miles long, but only ten or fifteen miles wide; and as the mountains shut it off from the interior, it was natural that its inhabitants should turn to the sea as the easier outlet for their commerce. The Phoenicians, therefore, became fishermen and sailors, and soon developed into the chief maritime nation among the ancients. They belonged to the Semitic race, being closely allied to the Hebrews, Arabs, and Babylonians.

Antiquity. — They were known to the ancient Akkadians, the primitive inhabitants of Babylonia, and, according to tradition, came from the shores of the Persian Gulf. The exact dates of the founding of their cities, among which Tyre and Sidon were the chief, are not known, but they belong to a very remote period. It is said that the temple of Baal Mel-

karth, the Phoenician Her'cules, was founded 2750 B.C.; and it is recorded that the Egyptian king Ramses II. visited their country, finding evidences of an advanced civilization.

Early History. — The period of their greatest prosperity was from the twelfth to the seventh century B.C. During this time, however, they were frequently conquered by foreign nations. Egyptian monarchs forced them to pay tribute, and Assyrian kings several times overran their country. The Phoenicians were not, in fact, a military people. They were essentially traders, and loved peace. Moreover, there was no strong central government. Each city managed its own affairs, and was virtually independent, though one among them commonly enjoyed a supremacy over the rest. In the early part of this period this position of supremacy was held by Sidon, which became the first great colonizing city of antiquity. Her devotion to trade, and love of the pursuits of peace, are alluded to in the Book of Judges, when, speaking of the people of Dan, it is said, "They dwelt careless, after the manner of the Zidonians, quiet and secure." But Sidon soon gave place to the more powerful city of Tyre.

Tyre. — The height of Tyrian power was reached in the tenth century B.C., when a king named Hiram ruled the city. Hiram was the friend of David and Solomon, with whom he entered into an alliance resulting in great advantages to both countries; for, while Phoenician culture was introduced among the ruder Israelites, David's conquest of Edom opened the way for Phoenician commerce through the Red Sea. Under Hiram, Tyre was adorned and fortified, colonies were planted in distant lands, and manufactures and commerce flourished. For some years after his death the affairs of the city prospered. Sidon was brought under its sway, and a colony was founded in the interior of Africa; but Assyrian conquests soon began to spread westward, and in 870 B.C. the kings of Tyre, Sidon, and two other Phoenician cities were obliged to pay tribute.

Founding of Carthage. — Before the close of this century the Tyrians founded on the northern coast of Africa a colony

which was destined to survive and outshine the mother city. This was Carthage, which, according to tradition, was settled by fugitives from the tyranny of a Tyrian usurper named Pygmalion. Greek and Roman writers have confounded legend with history, and made the founding of Carthage the subject of a picturesque story.¹

Later History. — The Phœnician cities continued to pay tribute to the Assyrians for many years. Occasionally they revolted, but fresh invasions of the Assyrians brought them to terms. The invaders, however, were not always successful. Sargon was obliged to grant easy terms to Tyre before it would capitulate after one of these revolts, and Sennacherib was unable to take the city (701 B.C.). Assur-bani-pal and also the Babylonian king Nebuchadnezzar were glad to buy its submission by favorable treaties. The maritime power of the Phœnicians made them useful allies to the Egyptians and the Persians, who successively exercised a supremacy over them. It is said that their refusal to attack Carthage made it impossible for the Persian king Cambyses to carry out his plans against that city.

Nevertheless they gradually lost their commercial importance. Wars and foreign domination weakened them at home, and in the sixth century B.C. the Greeks became formidable rivals in the planting of colonies. The Phœnician colony of Carthage inherited the greatness of the mother country, and built up an empire which, as we shall see, rivaled that of Rome. The ancient Phœnician cities fell into decay; and finally Tyre, the greatest of them, was conquered by Alexander the Great in 332 B.C. Its citizens were massacred or sold into slavery, and its greatness departed forever. Phœnicia became a part of Alexander's empire, and later was included in the dominions of Rome.

¹ In Vergil's *Aeneid*, Carthage is said to have been founded by the beautiful Dido, whose husband, Sichæus, the rightful ruler of Tyre, had been murdered by Pygmalion (see *Aeneid*, Book IV.). It is thought that Greek and Roman writers had confounded the foundress of the city with the Phœnician goddess Astar'te, who was sometimes worshiped under the name of Dido.

Colonies. — Besides Carthage, the greatest of their colonies, the Phoenicians made settlements in Crete, Rhodes, Cythe'ra, and other islands of the Grecian Archipelago, and even on the mainland of Greece. Farther westward they planted colonies on the coast of Africa, the islands of Sicily, Sardinia, and Corsica, and, passing through the Strait of Gibraltar, founded Ga'des (Cadiz) in Spain. The city of Tarshish, so often mentioned in the Bible as a place of great wealth and commercial activity, is also said to have been on the coast of Spain. It was a flourishing city in the time of Solomon, as appears from the passage in 2 Chron. ix. 21: "For the king's ships went to Tarshish with the servants of Hiram: every three years once came the ships of Tarshish bringing gold, and silver, ivory, and apes, and peacocks." These colonies of the Phoenicians were active trading posts, exchanging the products of the new countries for the luxuries of the East. In founding them they entered upon a different policy from that practiced by either the Egyptians or the Assyrians, who sometimes conquered and annexed territory, or plundered or exacted tribute from its inhabitants, but did not plant colonies. The Phoenicians settled in the land, and traded with the natives. In so doing they rendered the latter a great service by spreading among them a higher civilization.

Racial Character and Influence. — As a race, the Phoenicians lacked originality, but were skillful imitators, or rather adapters, of the ideas of other peoples. Thus, their art borrowed many of its forms from Babylonia, Egypt, and Assyria; and their science was an inheritance from neighboring races. But they did not merely imitate: they imparted a new character to what they borrowed, and showed a remarkable power of improving on their models. Their main strength lay in practical matters, such as the practice of industrial arts and the conduct of commercial enterprises. They were the most skillful artisans in the ancient world, as well as the most enterprising traders. In gem cutting, dyeing, and the manufacture of pottery, they were especially expert. The 'Tyrian purple,' a dye manufactured

from the *murex*, or purple-fish, was known throughout the civilized world, and the commercial prosperity of Tyre was at first largely due to its production. In commerce no race had ever before covered so wide a field. They brought tin from the island of Britain, precious metals from Spain, ivory and pearls from India. As a result of their commercial spirit and skill as colonizers, they became the dispensers of Asiatic civilization to Western nations. The Greeks especially felt their influence.

Literature. — The Phoenicians were not a literary race, and only scanty fragments of their writings remain; yet they are credited with having rendered literature an inestimable service by giving the Greeks their alphabet, which, through the Greeks, became the alphabet of the Western world. The alphabet of the Phoenicians was based on the old Egyptian hieroglyphics, but differed from the latter in being exclusively phonetic; *i.e.* in employing each letter to indicate a distinct sound. The Greeks themselves said that a certain fabulous personage named Cadmus introduced sixteen letters into use in Greece, and that other letters were added by their own wise men.

This, like the other stories relating to Cadmus, is a myth, but points to the fact, now generally admitted, that Phoenician colonists brought the alphabet into Greece.

Religion. — Phoenician religion was gross in conception, and sensual in practice. The center of their worship was the sun god, but his many forms or manifestations each took on the character of a separate divinity. Baal was the name given to the deity in all his forms. The supreme god was Baal Samen ('lord of heaven'); but especial worship was paid to another Baal, the cruel Mo'loch, called by the Jews the "abomination of the children of Ammon." Moloch delighted in the blood of human victims; and in the hope of appeasing him parents

offered up their children for sacrifice, the cries of the victims and of their relatives being drowned by the noise of drums and musical instruments.

There were several female divinities, the consorts of the male. Thus, Ash'toreth, known to the Greeks under the name of the goddess Astar'te, was identified with the moon, the consort of the sun god. She was worshiped with cruel and impure rites. Then there were many minor gods and goddesses associated with natural forces or inanimate objects, — Asherah, the goddess of fertility, the Baalim, that represented rivers, — and the gods of particular localities or cities. It is curious to note that several of the Greek gods were of Phoenician origin, while the Phoenicians themselves borrowed them from the Babylonians or Chaldeans. Thus, the old Chaldean solar hero, with his many adventures, his great feats of strength, and his 'twelve labors,' reappeared as Baal Melkarth, the god of Tyre, who in turn became the Hercules of Greek mythology.

CHAPTER VII

CHINA AND INDIA

I. CHINA

THE Chinese are a Mongolian people of the Turanian race, occupying the eastern slopes of the tablelands of Central Asia. Their early annals are a matter of legend rather than history, and authorities differ as to the date of the foundation of the empire. Some place it about 2800 B.C., and others about 2200 B.C. This purely legendary period lasted till 1123 or 1122 B.C., after which the records bear some traces of authentic history. Among the tales told of the earlier period is an account of a golden age, during which people led good and happy lives, and required little restraint by laws; and another legend refers to a great flood as occurring about 2200 B.C. In 1123 or 1122 B.C. the Chow dynasty came to the throne in the person of Wu Wang, who was famous as a lawgiver, and introduced important changes in the political system, dividing up the kingdom into vassal states. Under his successors the vassal princes gained power at the expense of the throne, and the state was greatly weakened by internal disorders; but in 255 B.C. a new line of rulers, the Tsin dynasty, put an end to this anarchy, and ruled with a firm hand. Members of this line held the throne till 206, and during this period work was begun on the "Great Wall," which was to guard the frontier against the barbarous nomads to the north. When completed, it was about fifteen hundred miles in length. The Han dynasty followed, and lasted till 263 A.D. This was a very flourishing period in Chinese history. The government was efficient, learning was revived, and the robber tribes on the borders were beaten back.

Chinese Civilization. — The government was despotic in form; but though the emperor had the power of life and death over his subjects, he was in some degree restrained by precedents

which were regarded as sacred. Three forms of religion were professed by the Chinese,—Confucianism, Taoism, and Buddhism. Of these the first two were native forms of faith, while the third was introduced from India. Confucianism is based on the teachings of Confucius (551–478 B.C.), many of which show a high morality, and apply practically to the daily life of the people. The founder of Taoism was Laou-Tse, who was a few years older than Confucius. His teachings are more

CHINESE TEMPLE

mystical and speculative than the latter's, and have not entered so deeply into the social life and political system of the people. Some account of the doctrines of Buddhism will be given in succeeding paragraphs on India. It was introduced into China in the second century B.C.

The Chinese civilization has been characterized by a peculiar exclusiveness and an undue reverence for tradition. Yet in

the matter of inventions the people have shown great ingenuity. The arts of printing and of making gunpowder and the use of the compass are said to have been known to them centuries before they were understood by European nations.

II. INDIA

Geography. — India occupies the great peninsula of southern Asia, stretching from the mountain region of the Himalayas southward into the Indian Ocean, by whose two arms—the Bay of Bengal and the Arabian Sea—it is bounded respectively on the east and on the west. On the north the lofty Himalayas slope down to plains of great extent, watered by the Indus, Ganges, and Narbudda rivers. To the south of these lies a hilly region, known as the Deccan.

The People. — The earliest inhabitants of India were a dark-skinned people, of whom few traces remain. What is known of them comes chiefly from the writings of their conquerors. These conquerors were of pure Aryan blood, and entered India from the northwest at some time previous to 2000 B.C. Their migration was a part of that movement of the Aryans which brought the Persians into western Asia, and the ancestors of Greeks and Romans into southern Europe.

The Language. — These Aryan invaders of India, or Hindus, spoke the Sanskrit language, which is regarded as the oldest

अग्निमीळे पुरोहितं यज्ञस्य देवमृत्विजम् ।

होतारं रत्नधातमम् ॥१॥

THE FIRST STANZA OF THE RIG VEDA, IN SANSKRIT CHARACTERS

Aryan tongue, and the nearest to that spoken by the original Aryans. Sanskrit is the language of

their Vedas (*vā'dā*), or collections of sacred writings, of which the oldest was the Rig Veda (probably 2000 B.C.), containing a large number of hymns to the gods, written during the period of warfare with the natives.

The Conquered Race.—Six hundred years (2000–1400 B.C.) passed before the conquest was complete, for the natives were numerous and brave. It appears from the Rig Veda that the invading race was far ahead of the natives in civilization. The latter were panic-stricken at the sight of the horses and chariots of the Hindus, against whose javelins, battle-axes, and swords they had only the rude weapons of savages with which to defend themselves. It was a conflict like that between the European settlers in America and the Indians, the Hindus feeling themselves to be a superior race. They too were white men, and the color line was sharply drawn. In fact, their word *varna*, meaning ‘color,’ came afterward to mean a ‘caste,’ or a distinct social class, class distinctions being further developed and more rigidly observed among the later Hindus than among any other people in the world.

Nature Worship.—The religion of this early period was a form of nature worship, the different natural elements or forces being personified as divine beings. Thus, there was the sky god, worshiped under various names, of which Indra, or the ‘sky that rains,’ occurs the oftenest, for in India the luxuriance of the crops was especially dependent upon the abundance of rain. In course of time Indra became their chief deity; but there were many others, such as Agni (*ag'nee*), the fire god, Va'runa, the god of the waters and the night, Vayu (*vah'yoo*), the wind god, and U'shas, the goddess of dawn.

Period of Expansion (1400–320 B.C.).—Having completed the conquest of the natives about 1400 B.C., the Hindus settled on the plains along the Ganges. They were divided into several tribes, and the half-mythical record of their wars and rivalries gives the earlier part of this period (1400–1000) the character of an heroic age like that of the legendary Greeks whom Homer described in the *Iliad*. Before the close of the fourth century B.C. they had occupied all the inhabitable lands of India. In the meanwhile, one of their states, Mag'adha (South Behar), grew in strength, and came to exercise control over some of the others, although it did not reach the height

of its power till after the close of this period (320 B.C.). But the main interest of the period is not in wars and dynasties; it is in the social and religious development of the people. During this time the caste system became firmly fixed, and two forms of religion successively arose, — Brahmanism and Buddhism, — each differing widely from the simple nature worship described above.

Caste. — From the time when the Hindus settled on the Ganges there was a marked change in the spirit of their religion. It lost its simplicity, and laid more and more stress on forms and ceremonies. Worship was complicated by elaborate and minute regulations, determining, for example, the exact pronunciation of words, the proper time (calculated astronomically) for holding the ceremonies, and every movement of the worshiper during the service. Such an elaborate system required the attention of a special class; and the Brah'mans or priests, who understood its mysteries, came to hold a place apart from other men, and to be viewed with peculiar reverence. The women of priestly families were forbidden to marry outside of their class, and as time passed the line that separated the priests from other members of society became more distinct. They became a separate caste.

The next caste below the Brahmans was that of the Kshat'riyas or warriors, who in turn were superior to the third caste, composed of the Vaisyas (*vī'shyā*) or farmers. Below the farmers was a still lower order in the social scale, the Su'dras or serfs, a despised class, probably descendants of the conquered aborigines; and lowest of all were the Pari'ahs, who were mere outcasts.

In European countries there have been social distinctions corresponding to these Indian castes, but they have not been so strictly observed. There has always been some intermarriage between the classes. In India the caste system was carried too far, and proved hurtful. There was great inequality in the laws. A Brahman paid a far lighter penalty for an offense than was imposed upon a Sudra. The latter could

be put to death for several classes of offenses, but a Brahman could never suffer capital punishment under the law. Moreover, industrial progress was checked by a rule that caused all who worked at a trade or tilled the soil to be regarded as degraded. Vaisyas and Sudras, however industrious they might be, could never gain admittance to either of the higher orders.

Brahmanism. — The old nature worship, in which natural forces were personified as different gods, gave place, in the course of time, to a belief in a single god as the cause and mover of all natural forces. Brah'ma was the name of this divine being. He was the creator of all things, but he was not viewed apart from what he created. He was thought to be in all his creatures, which have sprung from him, and will return to him. This doctrine is embodied in the books of instruction called Upanishads', which are among the most remarkable works of antiquity. According to the Upanishads, the great truth of religion was revealed to a simple and illiterate boy, who spent his days alone, tending cattle. This truth was that "the four quarters, and the earth, the sky, the heavens beyond, and the ocean, and the sun, the moon, the lightning, and the fire, and the organs and minds of living beings, — yea, the whole universe, is God."

Another remarkable feature of Brahmanism was the doctrine of the transmigration of souls, — the idea that the soul, springing from Brahma, passes through various bodies, until finally, having freed itself from all imperfections, it goes back to Brahma again. The great aim of existence was to reach this final state, and mingle with God.

Buddhism. — Brahmanism passed through the experience common to many forms of religion, losing in the course of time its simplicity and earnestness, and requiring reformers to remind believers of its essential truths. Of these reformers the greatest was Prince Gautama (*Gow'tama*), commonly known as the Buddha (*Bōōd'da*), or 'the Enlightened,' whose reforms were of such a radical nature as virtually to found a new

religion. Yet he did not quarrel with the old, but merely interpreted it anew, and gave it a more practical character.

Buddha was born about the middle of the sixth century B.C. He was a member of a royal house, but left his home, his wife, and newborn child in order to find religious peace and

STATUE OF BUDDHA, JAPAN

the way to salvation. He sought truth from the Brahmins in vain, and spent seven years in religious meditation. Finally he learned the truth that he had been seeking. It was summed up in the two ideas of self-culture and universal love. About 522 B.C. he proclaimed his creed at Benares. As to the details of worship, he left the ancient Brahmanism unchanged; but he taught that every act in this life bears its fruit in the next. Every soul

passes through successive lives or reincarnations. Its condition during one life is the result of what it has done in a previous state. The aim of life is the attainment of Nirvana (*Neervah'na*), — a sinless state of existence, to reach which constant self-culture is required. Four truths were taught especially: first, that all life is suffering; second, that this suffering is caused by the desire to live; third, that the suffering ceases with the cessation of this desire; fourth, that this salvation can be found by following the path of duty. A very high morality was preached, including the duties of chastity, patience, mercy, fortitude, and kindness to all men.

Spread of Buddhism. — Buddha, after his death, was worshiped as a divine being. His disciples carried the faith throughout

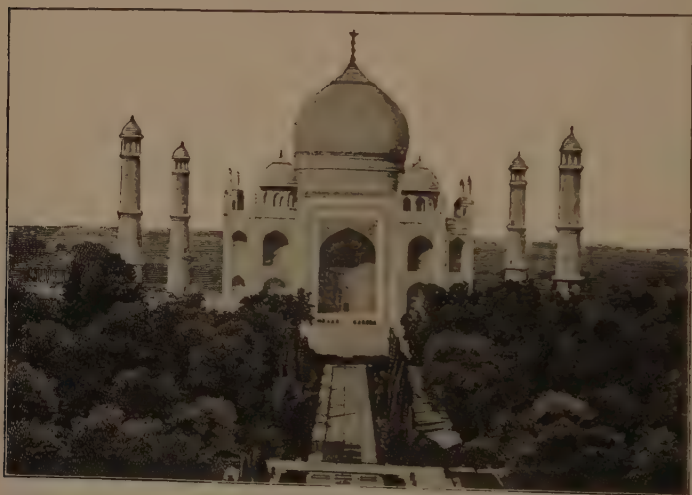

India, and thence it spread to China in the second century B.C., over Burmah 450 A.D., and over Siam and Java at later dates. In 377 B.C. there was a division among the Buddhists. The Northern Buddhists (*i.e.* those of China, Thibet, Nepal, and Japan) profess different doctrines from the Buddhists of Ceylon. In India Buddhism and Brahmanism existed side by side, and the modern faith known as Hinduism is a combination of both.

Greek Conquest of India. — India was first brought into contact with Europeans by the conquest of Alexander the Great in 327 B.C. Alexander found northern India divided into little kingdoms, many of which were less hostile to the conqueror than to one another. He reached the Hydas'pes or Jhe'lum River without fighting a battle, and finally passed down the River Indus to its mouth, having won several victories over the brave but ill-disciplined Hindus. His conquest comprised only northern India, which after his death fell to the share of Seleu'cus Nika'tor, the founder of the Syrian kingdom.

Alexander founded cities in the conquered country, and Greek influence is traceable in Hindu art for many years afterwards. But the most important result of the conquest was in giving us the first European account of India. This was the narrative of Megas'thenes, a Greek ambassador at the court of Chan'dragup'ta, an Indian prince who had succeeded in building up an empire in northern India after Alexander's departure. Megasthenes' account of Indian society in 300 B.C. shows it to have been in essential points about what it is at the present time. He notices the caste system and the division of the country into over a hundred kingdoms. He speaks with admiration of the purity of the women and the courage of the men. The people were remarkably law-abiding and truthful.

Arts. — There are many beautiful remains of ancient architecture in India, dating from the Buddhist period, and including churches, monasteries, and high stone structures (known as *topes*) built on sacred spots, to which pilgrimages were made. Buddhist churches and monasteries were often grot-

toes cut in the rock, and were frequently elaborately sculptured. Great numbers of these structures are found in the Presidency of Bombay, where rocks fitted for excavation abound. The rock-hewn temples of Ello'ra, belonging to the eighth or ninth

THE TAJ MAHAL, AN INDIAN TOMB

century, are the most remarkable of these. A pit measuring 270 feet by 150 feet is cut in the solid rock, and in the midst of it stands a temple with a tower 90 feet high.

Commerce. — The commerce of India attracted many traders. Phoenician caravans and ships carried the precious stones, gold, ivory, spices, and silks of India to the West. In later times the wealth of India played an important part in history by attracting the trade of the Italian cities. This trade, during the fourteenth and greater part of the fifteenth centuries, passed overland through Arabia and Asia Minor; but when the Portuguese, at the close of the fifteenth century, discovered the route around the Cape of Good Hope, the commerce of the Indies was carried on by sea, and passed from under the control of the Italian cities into the hands of

the nations on the Atlantic coast. The later history of India, however, has its main interest in its connection with Portugal, Holland, and England, and will be discussed in the chapters on the modern history of those nations.

CHAPTER VIII

THE MEDES AND THE PERSIANS

Race. — The Medes and the Persians were kindred tribes belonging to the Aryan division of races. At a very early date they had come westward from Bactria, and when first heard of in history were occupying the western part of the table-land of Iran and the shores of the Persian Gulf. The Medes, who lived in the more northerly of these regions, were the first to emerge from barbarism and build up an empire.

The Median Kingdom. — The earliest mention of the Medes was in 840 B.C., when they appear to have been one of the subject peoples of the Assyrian king Shalmane'ser II. As the power of Assyria declined, that of Media increased, until a Median prince named Cyax'ares destroyed the Assyrian Empire in 606 B.C. Further conquests by this ruler raised Media to the first rank as an Asiatic power; Lydia on the west and the restored Babylonian kingdom on the south being her only rivals. The river Halys became the boundary between his empire and Lydia on the west, and he made the Persian tribes on the south his subjects; but the Median supremacy lasted only a few years. Asty'ages, the weak successor of Cyaxares, could not hold his kingdom against a powerful rival who had arisen. This was Cyrus the Great, king of the Persians.

Cyrus the Great. — While Astyages was ruling over Media, the Persians, under their king, Camby'ses, were in a position of dependence, and paid tribute to the Median king; but with the accession of Cyrus to the Persian throne all this was changed. The early life of Cyrus, like that of many other heroes of antiquity, is very obscure. There is a story that

Astyages, the Median king, having dreamed that Cyrus was destined to conquer all of Asia, gave him to a courtier with orders to have him killed. The courtier handed him over to a shepherd, who agreed to expose him on the mountains. The shepherd pretended that he had done so, but spared the life of the young Cyrus, and brought him up as his own child. The king afterwards found this out, and took a barbarous revenge on the courtier, killing the latter's child, and serving him up to his father as food. But after a while the courtier's turn came for revenge. A rebellion having broken out, he sent for Cyrus to head the movement; and the result was the overthrow of Astyages, and the elevation of Cyrus to the throne. This story is probably a later invention; all that we know with certainty is that Cyrus triumphed over the Median Astyages, and made himself the ruler of Medes as well as Persians.

The Conquests of Cyrus.—The Median kingdom was overthrown in 557 B.C. There now remained two great rivals to the new kingdom, namely, Lydia and Babylonia. Cyrus first turned against Croesus, King of Lydia, and in a single campaign captured Sardis, the Lydian capital, and made Croesus his prisoner. A tradition relates that when Cyrus was about to put Croesus to death, the captive king was heard to mutter several times the name of Solon, and, on being asked what he meant by it, replied that Solon, the Greek sage, had been the only man who refused to call him fortunate, saying that no man should be called happy before his death, for the reason that no one knows what evils may befall him. Cyrus, according to the legend, thereupon spared the life of Croesus, and received him into his confidence. This story also rests on a slender basis of fact, but is significant as illustrating the leniency which the Persians showed their captives at a time when prisoners were almost invariably put to death and often barbarously tortured.

With the conquest of the Greek colonies on the Aegean, western Asia Minor was added to the Persian Empire. Next came the fall of Babylon, about 538 B.C., which led to the important

result of enabling the Jewish exiles to return to Jerusalem. Cyrus died in 529 B.C., after having raised the Persian kingdom from the position of a tributary state to that of the greatest imperial power in Asia. His sway extended from the Mediterranean shore to the river Jaxartes, and from the Indus to the Hellespont. He was by far the greatest of the Persian monarchs, and his conquests were not disgraced by cruelty.

Cambyses (529-522 B.C.).—In the reign of Cambyses, son of Cyrus, occurred the conquest of Egypt. This prince had something of his father's warlike character, but lacked his ability and his clemency. Angered, it is said, by a deception practiced on him by the Egyptian king, he invaded the latter's territory and captured Memphis. Here the conqueror is said to have behaved with such wanton cruelty as to give color to the belief that he was insane. He assumed the title and powers of an Egyptian king, but did not succeed in subduing the entire country. His long absence permitted political and religious revolts at home. The different races which Cyrus had bound together in his empire now tried to regain their independence. Failing to subdue the revolt, Cambyses committed suicide.

Darius Hystaspes (521-485 B.C.).—A usurper seized the kingdom on the death of Cambyses; but Dari'us, the rightful heir, killed him and gained the throne. Darius was the great organizer of the Persian Empire. He divided the country up into more than twenty provinces or satrapies, at the head of each of which was a governor or satrap, bound to do the bidding of the king. The government was a perfect despotism, the king having power of life and death over all his subjects. The government has been compared to that of Turkey to-day, — a system in which the officers owe all their authority to a ruler who is responsible to no one for the use of his power. Vast wealth poured into the imperial treasury from the provinces; and the great king was able to fit out military expeditions against Scythians, Thracians, and Greeks. The conflict with the Greeks, however, and the story of Mar'athon, where Athenian valor drove back the greatly superior forces of the Per-

sians, fall more properly within the scope of Greek history. The main interest of Persian history from this time on lies in its relation to Grecian affairs, and will be discussed in connection with them.

Religion. — The religion of the Medes and Persians was one of the highest and purest forms of faith found among ancient peoples. At first, like most savage tribes, they worshiped natural objects and natural forces. Some of these forces were regarded as the manifestation of good spirits, and others of evil demons; and out of this grew the idea of a perpetual conflict between good and evil in the universe.

Zoroastrianism. — Long before their authentic history begins, a Bactrian priest named Zarathush'tra or Zoroäs'ter, who is supposed to have lived about 650 B.C., reduced this crude nature worship to definite form. The chief feature of Zoroastrianism, as the Persian religion is called, is the belief

in a god of light (the creator of all that is good) and a god of darkness (the founder and promoter of all that is evil). The former they termed Or'muzd, and the latter Ah'riman. Each was at the head of a host of minor gods; those under Ormuzd being the "undying and well-doing ones," while those who aided Ahriman were the gods of evil thoughts, of death, sickness, and decay. It was thought that the world would last 12,000 years, after which it would end in winter or storm. Then would come a period of eternal spring, when the earth would be repeopled by the good, whose bodies would rise from

DARIUS

From an ancient relief. Above,
the symbol of Ormuzd

the dead. Certain animals and natural objects were regarded as sacred. Thus, fire was looked upon as a manifestation of Ormuzd, and hence worshiped; and among animals the dog was revered. The sacred writings were gathered in a work called the *Avesta*, written in the Zend language, which is thought to be the language of ancient Bactria.

The Magi. — Such was the real essence of the Persian belief. There is evidence to prove that among the more enlightened worshipers there prevailed a belief in pure monotheism, that is, in one eternal Spirit above both Ormuzd and Ahriman: but the creed differed at different times, and was corrupted by the priestly class. The members of this class were called Ma'gi. Their origin is uncertain, but they seem early to have become the directors of worship, and to have won a high place in the councils of the king. Darius accused them of corrupting the ancient faith, and it is probable that they deprived it of its real spirit by laying too much stress on forms and ceremonies. They were astrologers as well as priests, and are especially associated with the worship of fire, although their veneration was by no means confined to that element. Our term 'magic' is derived from their name, in allusion to the arts which they practiced.

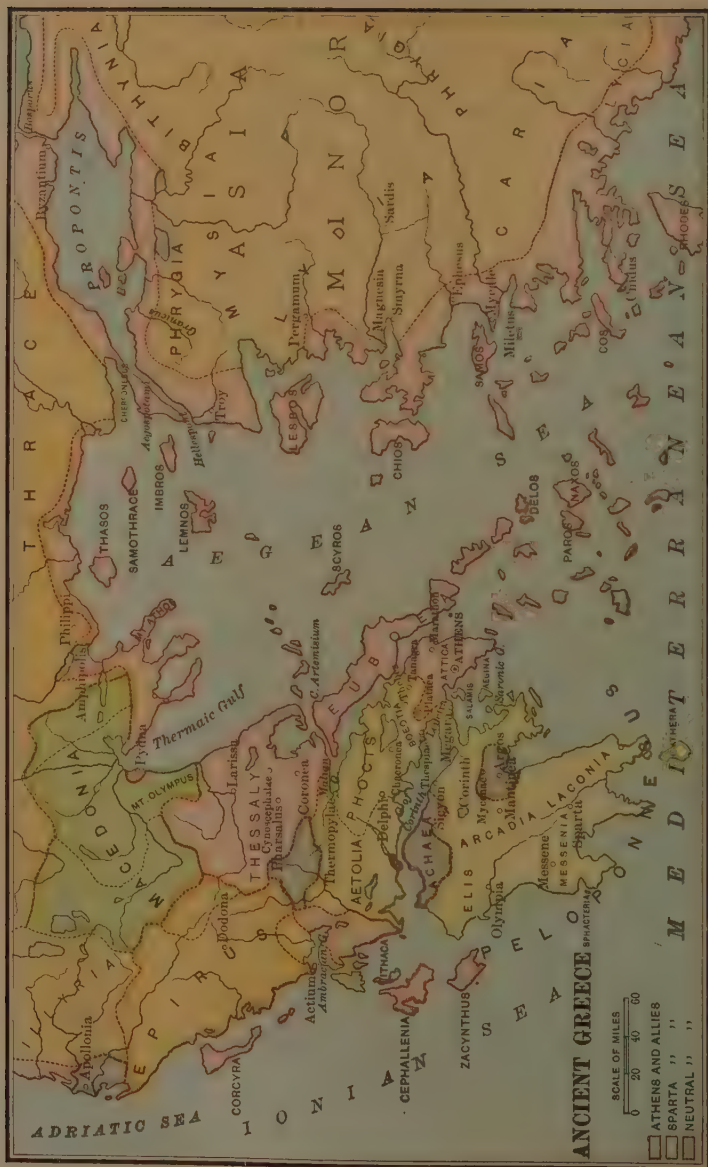

Manners. — The Persians had an especial reverence for the truth. Lying, stealing, deception of any kind, were held in detestation. But if truthfulness was a Persian virtue, drunkenness was to the same extent a Persian vice, for the too free use of wine characterized society from the court down. Another vice was the cringing spirit they often showed toward their rulers, and their habit of flattery, the outcome of the extreme despotism of their government. The punishments which this government meted out to offenders were often very cruel, even for slight crimes. Xen'ophon, the Greek historian, writing in the early part of the fourth century, says it was a common thing to see men lacking a foot, or an arm, or an eye, as a result of punishment inflicted for some offense. Yet toward their prisoners of war the Persians showed remarkable kindness.

As to their occupations, they were not a commercial people, but confined themselves chiefly to agriculture. In fact, a regard for agricultural pursuits was taught by their religion. Their dress was that of a cold climate. They wore boots, stockings, trousers, and cloaks, which, in the case of the nobility, were often of very costly material and bright colors. In their later days they were not good soldiers. They depended on force of numbers and strategy rather than valor, and it was usual for commanders to flog their troops into battle. A lively, quick-witted people, they lacked stability of purpose and the capacity for sustained and vigorous action. Polygamy was practiced among them.

Art and Literature.—In art the Persians were borrowers from the Babylonians and Assyrians. Their architecture was heavy, severe, and formal, but diversified by graceful columns. Like the Babylonians, they colored the walls and ceilings of their palaces. In their figures there is the same thickness of arms and legs that marks the Babylonian bas-reliefs, and the winged bulls that appear so frequently in Assyrian architecture occur often in the Persian ornamentation. The best type of Persian architecture that survives is found in the ruins of Persepolis, burned by Alexander the Great. Of their literature, all that remains is a portion of the Avesta. They were not a literary people, and they contributed nothing to science.

GREECE

CHAPTER IX

THE PREHISTORIC AGE

Geography. — The Greeks called their land Hellas and themselves Helle'nes, our words Greece and Greek being derived from the Latin names of the land and its people. Greece, or Hellas proper, is the southern part of the most easterly of the three peninsulas that project southward into the Mediterranean Sea. The Cambunian and Olympus mountains bound it on the north. It is very irregular in shape, but may be roughly divided into three parts. The northern division consists of Epi'rus and Thes'saly, south of which the Ambracian and Malian Gulfs indent the land on either side, reducing the width of the peninsula to sixty-five miles. The middle divi-

PALLAS ATHENE

sion, or central Greece, is south of this point, where the land widens again. Below central Greece two other gulfs, the Saron'ic on the east and the Corinthian on the west, cut far into the country, leaving only the narrow

strip called the Isthmus of Corinth between. This isthmus, which is about three and a half miles across, joins central Greece with the third or southern division, called the Peloponnesus (island of Pelops) or in modern times More'a (mulberry leaf). The surface of Greece is as irregular as its outline. Ridges of limestone mountains traverse the country in all directions, making it a land of hills and valleys and small plains. In Greece there is no point from which the mountains can not be seen.

Effect of Physical Features of Greece on the People. — The long and irregular coast line of Greece and the subdivision of its surface by mountain ranges have had an important influence on the history of its inhabitants. With an area about that of our state of Maine and less than that of Scotland, Greece, owing to its numerous bays, gulfs, and inlets, has a coast line equal in length to that of Spain and Portugal together. These indentations brought the sea within easy reach of the dwellers in almost every part of the country. The effect of this was to make the water the easiest means of communication between the different parts of Greece, and so accustom them to sea voyages. Moreover, the waters that surround the peninsula are studded with islands, especially on the east, where the islands of the Aege'an Sea are so near one another that a ship can pass from Greece to Asia Minor without ever losing sight of land. It is not strange, therefore, that the Greeks were from very early times a race of sailors, and that they came in time to possess in the ancient world the same sort of maritime supremacy as that enjoyed later by the Venetians, the Dutch, and the English.

The division of the land by mountain ridges largely explains another characteristic feature of Greek life; namely, the lack of political unity among the people. In spite of the bond of race, the ancient Greeks did not succeed in founding a national state, but lived in independent communities — a condition which the existence of these natural barriers of hills or mountains tended to produce.

Race.—In prehistoric times Greece was occupied by people to whom the Greeks gave the name 'Pelas'gi' (Pelas'gians). Their origin is doubtful, but by some of the Greek historians they were thought to be the ancestors of the Greeks themselves. They lived in villages, tilled the soil, kept flocks and herds, and left behind them remains of massive walls built of unhewn stone, but they never passed beyond a rude stage of life, or showed anything of the genius of the later inhabitants. If they were not the ancestors of the Greeks, they were, like the latter, of Aryan blood. It is probable that at some time previous to 2000 B.C., the Aryans had reached southern Europe and then divided into two swarms, of which one settled in Greece, becoming the ancestors of Pelasgi and Greeks, and the other passed further westward and peopled Italy.

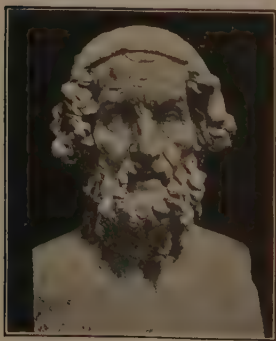

The Hellenes, or Greeks proper, traced their descent from a mythical ancestor, Hellen, a native of Thessaly, and from his equally mythical sons, whose names — Dorus, Ion, Ae'olus, and Achae'us — are preserved in the names of the four chief divisions of the Hellenes, the Dorians, Ionians, Aeolians, and Achaeans. Of these the Achaeans were at first the most powerful. They and the Aeolians were scattered throughout the peninsula, while the Ionians occupied the eastern coast and islands, and the Dorians, the latest comers, occupied the mountains in the north. This disposition of the tribes, however, is largely a matter of conjecture; for it belongs to the prehistoric period for the account of which we have to rely on traditions. Authentic history begins with the migration of these tribes into the regions which they occupied permanently.

Legendary Period.—The myths, or stories with which the Greeks filled up the dark period before their genuine history began, are not only interesting in themselves, but have a value for the light they throw on the early life of the people. It was called the Heroic Age, from the fact that so many of the legends deal with the exploits of heroes — founders of cities, lawgivers, and leaders, whose improbable adventures and superhuman deeds were the creation of their imaginative

descendants. Yet the tales about them often point to some historical fact. Thus Athens, Thebes, and Argos all claimed as their founders foreign heroes who came into Greece from the East. In Athens a mass of legends gather about the dynasty of Ce'rops, the supposed founder of the city, who came from abroad, and The'seus, the last of this mythical line of foreign rulers, was the national hero of the Athenian state. In Thebes it was the equally mythical Cadmus who taught the people the art of mining, and how to read and write; and in Argos the hero Dan'aüs was thought to have founded a line of kings who made the city the greatest state in the Peloponnesus.

Probably the element of truth in all these stories is that the rude natives of Greece learned much from the enterprising and civilized Phoenicians, who frequented the coasts in the course of trade, founded trading stations on the islands and capes, and opened up mines in the country. The story of Cadmus points to the fact that the Greeks borrowed their alphabet from the Phoenicians.

The Homeric Poems.—Of all the writings that describe this Heroic Age, the most important are the two great narrative poems,—the *Il'iad* and the *Od'yssey*,—attributed to Homer. For many years scholars have disputed about the authorship of these poems, some denying that they were written by Homer, and holding that they were the work of many minds; others seeing in them a unity of style and harmony of treatment that mark them as the products of a single fancy. The latter view is the more generally accepted, yet it seems strange that we know so little of the author. The

HOMER

Greeks themselves, who never questioned the identity of Homer, were ignorant of the facts of his life, and joked about the number of cities that claimed to be his birth-

place. Two facts, however, are clear: the poems are of great antiquity, and their author describes very faithfully the times in which he lived, supplying materials from which historians have been able to construct a picture of primitive Greek society.

The *Iliad* and the *Odyssey* are two long epic poems dealing with a war against the ancient city of Troy (Ilium) in Asia Minor, and the events which resulted from the conflict. The first describes the siege of Troy by the Greeks in revenge for an injury inflicted on one of their kings, Menela'us, whose wife Helen, the fairest woman in all Greece, had been stolen away by a Trojan prince named Paris while a guest in the house of her husband. Agamem'non, king of Mycenae and brother of Menela'us, was the leader of all the Greeks, by virtue of his royal authority over the Peloponnesus; but the bravest and most powerful chieftain, without whom the Greeks could do nothing, was Achil'les.

GATE OF MYCENAE, THE CITY OF AGAMEMNON

It was ten years before the Greeks captured the city, their victory being delayed by the refusal of Achilles to fight in consequence of a quarrel with Agamemnon, and success came finally only through the stratagem of the wooden horse in which Greek warriors were concealed and borne by the unsuspecting Trojans into the heart of the city. Such is the bare outline of the story. The poem fills it in with stirring accounts of battles and adventures, and with a vivid description of the armies engaged.

The *Odyssey* tells the adventures of Odys'seus, or Ulys'ses, of Ithaca, who, after fighting in the Trojan War, was carried out of his course by a storm on his return voyage, and reached his home only after many years of wandering.

Greek Society in the Heroic Age. — The form of government that prevailed during the period described by Homer was the patriarchal monarchy, in which the king was regarded as the father of the tribe. He was not only its leader in war and the judge of disputes between its members in times of peace, but he was the chief priest of the tribe, their spokesman and agent in dealings with the gods. Yet he was not altogether without restraints, for his power depended on the general will, and if his government was unjust or his conduct on the field of battle cowardly or base, he was liable to dethronement.

Below him were the nobles, who were the only class having political rights. They were the advisers of the king, who, however, was not always bound to act upon their advice. The great mass of the people were freemen owning small parcels of land, but there was also a landless class who worked the land of others for hire. There were some slaves, but they never became numerous, nor do they seem to have been harshly treated.

Society, thus constituted, had the virtues and the vices of a rude but vigorous age. The spirit was aristocratic, and kings and nobles looked down upon the common people; yet there was little state or display. Manual labor was not, as in later times, regarded as a sign of degradation. Kings were not above working in the fields, and queens attended in person to the details of domestic management. Amusements were simple and healthful. Athletic games were common as in later Greece. Women were respected and polygamy was not practiced. The duties of hospitality were strictly observed. The stranger was received kindly, and to harm a suppliant was reckoned the worst of crimes.

On the other hand, it was a period of lawlessness. Piracy flourished, and plundering a weaker neighbor was regarded as a legitimate means of enrichment. Murder was common, and went unpunished unless the relatives of the victims chanced to demand reparation, in which case the matter was usually settled by a money payment. Then, too, the conduct of war

was barbarous. There was no thought of sparing the lives of prisoners, unless, perhaps, they could be made useful as slaves. Human sacrifices were sometimes offered to the gods.

The Nobles. The People. Life and Manners.

CHAPTER X

THE FIRST PERIOD OF GREEK HISTORY

Division into Periods. — In the previous chapter an outline has been given of the prehistoric age of Greece. Greek history proper may be divided into three periods. The first extends to about 500 B.C., and includes the early development of the principal states of Greece. The second is the most flourishing period of Greek history, from 500 B.C. to 338 B.C. The third period (338–146 B.C.) was an age of decline, during which the separate Greek states lost their independence, first falling under the power of Macedonia and finally under that of Rome.

The Migrations. — The dividing line between the legendary period and the beginning of authentic history is formed by several important migrations of Greek tribes, which resulted in great changes in the political map of Greece. The Thesalians, a savage tribe of northern mountaineers, came down and settled in the plains of Thessaly, driving out all who barred the way. The Dorians, Aetolians, and Boeotians were thus pushed southward and forced to find new homes for themselves. The Boeotians went no further than central Greece, founding there the state of Boeotia, which adjoined

the Ionian state of Attica. Aetolians and Dorians went down into the Peloponnesus, where the former seized upon the region in the northwest and the latter occupied all the southern portions. These movements threw all Greece into confusion. Up to this time the dominant race of Greece was the Achaeans, and the Dorians were unknown. Henceforth the Achaeans occupied merely a strip of the coast in the northern part of the Peloponnesus, while the Dorians gradually rose to a leading position among the tribes.

But the effect of these movements was not merely to change the position and relations of the tribes in the mainland of Greece. The displaced populations sought new lands across the sea, founding three great groups of settlements on the coast of Asia Minor and colonizing the islands of the Aegean together with Cyprus and Crete. The first of these Greek colonies in Asia Minor was founded by the Aeolians, who were fugitives of various tribes dislodged by the Dorian invasion. Theirs was the most northerly group of colonies, stretching along the coast from the Hellespont to the Bay of Smyrna. The settlements to the south of the Aeolian colonies were formed mainly by Ionian fugitives, and to the south of these were the colonies of the Dorians, for the conquerors themselves had found the limits of their new territories in Greece too narrow, and had passed over into Asia Minor.

The date of these movements is obscure. We only know that at their close the tribes were settled in the places that they continued permanently to occupy. Subsequent history deals with their development and mutual relations. The two chief states of Greece were Athens and Sparta, and about them the main interest centers. Athens did not come into prominence till many years after the migrations. It was not much affected by these movements, and still retained its old Ionian population. Sparta, however, was the chief city of the Dorian immigrants, and, having a brave, aggressive population, gradually fought its way to the position of the ruling city in the Peloponnesus.

CHAPTER XI

SPARTA

Rise of Sparta. — Of the three states founded by the Dorians in the Peloponnesus, namely, Sparta, Messenia, and Argos, Argos was the first to make herself supreme. During her ascendancy Sparta and Messenia were fighting with each other, and the former state found it hard to hold her own; for, owing to her bad system of government, she was weakened by misrule and anarchy. Finally, however, Sparta triumphed over both her rivals. This was due to a radical change in her form of government — to the establishment of a most peculiar system of laws and social customs.

Lycurgus. — This system was ascribed by the Greeks to a Spartan sage named Lycur'gus, who lived about 800 B.C. Finding the country distracted by the feuds of kings and the lawlessness of the people, he proposed a new scheme of government. His object was to make Sparta a great military power. To accomplish this, he introduced a system of the strictest military discipline. It made no difference whether the state was at war or at peace, this discipline was never to be relaxed. At the same time stability was insured in the government by the introduction of new administrative officers with clearly defined powers. Not all the peculiar characteristics of the Spartan system were the work of Lycurgus, but enough was his to give him a just title to the credit of being its founder.

Constitution of Sparta. — The Spartan state was under the joint government of two kings who were the absolute chiefs in time of war, the high priests of the people and the hereditary chief magistrates. As civil rulers, however, their authority was limited, for the government was rather aristocratic than monarchical. There was a Senate of elders who looked after public affairs, and the kings in times of peace merely had their votes among them like the rest. Then there was an Assembly

of the freemen, which could decide questions only when the Senate was divided. From this it is evident that the people did not have much voice in the government. At a later date there was created an official body of five magistrates called Ephors, who were selected by the Assembly of the freemen, and who became possessed of arbitrary power when the kings were away in time of war. As time went on, they acquired a superiority over the kings themselves. Two of them went with the king to war and thus always kept watch on his actions.

Spartan Education. — A Spartan's whole life was passed in the service of the state, which viewed him as a mere instrument for maintaining the power of his race. The sole object

THE RACE COURSE AT SPARTA

of his education was to fit him for this purpose. The state had its eye on him from his birth. If he happened to be a weakly child, he was exposed on Mount Tayg'etus to die. If he seemed worth keeping alive, his parents were allowed to bring him up; but when he reached the age of seven, he was taken from home and placed under state educators for training in the sort of exercises that would make him hardy and vigorous. He was obliged to go barefoot, to wear only a single

garment at all seasons, to cook his own meals, and to sleep on a bed of rushes. Small and unappetizing portions of food were allowed, for the express purpose of leading him to hunt or to steal; for the skill and strategy requisite for a successful theft were thought to be desirable accomplishments for a soldier, and punishment was not inflicted for the wrongfulness of thieving, but rather for the stupidity that permitted it to be found out. He was taught to endure the severest torture without showing signs of pain, and every one knows the old story of the Spartan boy who, having stolen a fox and concealed it under his shirt, permitted it to tear his flesh and kill him rather than betray the secret of the theft to his companions. Constant gymnastic training and military exercises were required of him, and almost his only amusement was the annual festival in which he competed in music, dancing, and athletic contests with his fellows.

Social Life and Character. — One of the most singular institutions of the Spartans was their system of public messes. Each mess was composed of fifteen men, who took their meals together in public. Limited portions of food were allowed, each member contributing his share. Custom fixed not only the quantity but the quality of the food, which consisted chiefly of meal, cheese, figs, and a coarse kind of black broth. As soon as a young man reached the age of twenty, he left the training house for the barracks, and from that time was not exempt from the requirement to take his meals at the mess until he was sixty years old. Not even after marriage was he free from this duty.

As to the military organization in the field, it surpassed that of any other Greek state. There were regular grades of officers with definite commands, as in our modern armies. Military maneuvers were executed with remarkable rapidity and precision. Everything was done to make a Spartan delight in war. Some of the annoying restrictions of peace were relaxed and life was made more agreeable for him when he was under arms.

The submission of a strong, high-spirited race to this galling interference of the state with what we regard as the most essential private rights seems very strange. It is in part explained by the fact that the system of Lycurgus was applied to a rude, unlettered people, who had developed no taste except for war. To make them invincible warriors was its object, and in this it was successful. Success and the weight of tradition fastened it more firmly upon them. Its effects on the Spartan character were very important. A Greek writer said somewhat contemptuously of the Spartan soldiers that it was not surprising they met death so willingly in battle, since their lives were made so unpleasant for them. Their bravery was undeniable. It was a matter of course. The coward was the exception, and the scorn felt for him was universal. Even the appearance of cowardice was feared more than death, and men sometimes killed themselves rather than return home after a defeat. So far, then, as fighting qualities were concerned, the Spartans were the foremost of their time.

In other respects, they were on a much lower plane. They cared nothing for art or literature. The oratory which made Athens famous was despised by the Spartans, who looked upon what was beautiful or picturesque as wholly superfluous, and aimed above all at that brevity of speech which we still describe as *laconic* (from Laconia, the name of their country). If their training made them brave, it made them harsh and cruel too. They neither showed nor expected mercy. They were ungenerous and deceitful in dealing with their foes.

In the most essential arts of civilized life they were very backward. Their aristocratic spirit forbade a citizen to labor with his hands. Commerce was forbidden, and the cultivation of the soil was left to slaves. Spartan money consisted solely of iron, which, from its bulk and weight, could suffice only for a very low order of industrial life.

The women received much the same kind of training as the men, and shared the latter's courage and physical strength. In public affairs, they had greater influence and showed more

ability than the women of the rest of Greece. On the other hand, they had something of the same hardness that distinguished the men. They were neither gentle nor modest. So, on the whole, the Spartan training developed a fine, brave, but unlovely race, a race better fitted for conquering others than for civilizing itself.

Early Spartan Conquests. — The effect of the reforms of Lycurgus was felt almost immediately. Within about fifty years of their adoption, Sparta conquered Laconia. Then followed two long wars with the Messenians. The first lasted from 743 to 723 B.C., and resulted in the defeat of the Messenians, in spite of the desperate resistance of their chief, Aristodé'mus, who offered up his daughter as a sacrifice to the Messenian national god. The Messenians remained vassals of Sparta for many years, but suddenly, when Sparta was in the midst of a war with Argos, they broke out in revolt under the leadership of Aristom'enes. Many stories are told of the valor of this Messenian hero. He is said to have killed 300 Spartans with his own hand, and to have visited Sparta by night and placed a shield in the temple of Athé'ne as an insult to his enemies.

At this time Sparta seemed on the point of destruction, for, besides the Messenians, she was fighting Argos and a league of Arcadian tribes. She was repeatedly beaten in the field, but held out stubbornly, encouraged, it is said, by the songs of the poet Tyrtæ'us, who predicted ultimate victory. Finally the alliance against her was broken, and she was able to crush the Messenians (about 630 B.C.). This time she made the inhabitants not vassals merely, but slaves. Argos was the next to suffer. Part of her land was taken from her, and thenceforth her power declined. Before the close of the sixth century B.C., Sparta had reduced all the states of the Peloponnesus except Argos to vassalage.

Helots and Perioeci. — As the Spartan dominions grew in extent, the ruling race came to form a very small part of the population, the bulk of which consisted of slaves and vassals,

the descendants of the conquered tribes. These subject peoples were divided into two classes, the *Perioeci* and the *Helots*. The *Perioeci* (meaning literally those 'dwelling around') were merely required to pay a tribute and send a certain number of troops to the Spartan army. They retained their personal freedom. On the other hand, the condition of the *Helots* was almost unendurable. They were the descendants of those tribes to which the conquerors, for some reason or other, had seen fit to mete out very harsh terms. Far more numerous than the ruling class, and coming from a race at one time free, they were nevertheless kept in the position of mere slaves, subject to every caprice of their conquerors. Naturally they were always ready for revolt, and the Spartans had constantly to be on their guard. It was this ever-present danger of an uprising of slaves that made the strict maintenance of military discipline especially needful among the Spartans. The latter followed successfully a policy of terrorism. A secret organization is said to have existed for the purpose of spying on the *Helots*, and making away with such of them as seemed likely to stir up revolt. The *Helots* always remained a despised and degraded class despite their superior numbers. The Spartans even made them fight in their armies. The land was worked by the *Helots*, but owned by the Spartans, who lived in their barracks in the city and enjoyed the fruits of their serfs' labor.

CHAPTER XII

ATHENS

The Athenian Monarchy. — Athens lagged far behind Sparta in its development. Down to the sixth century B.C. it was a comparatively unimportant state. During the early period of its history it was ruled by kings, the first of whom was Cecrops, a foreigner, probably a Phoenician, and the founder

of the dynasty called Cecrop'idae. The lives of these rulers fall within the Heroic Age, and accounts of them are merely legendary. The last of this line was The'seus, who was worshiped by the Athenians as their national hero and the real founder of the state.

It was under the next dynasty that Athens came near falling under the power of the Dorians, who, having overrun the Peloponnesus and the Isthmus of Corinth, invaded Attica and captured the city of Meg'ara. According to a legend, Codrus, who was king of Athens at the time, saved the city at the sacrifice of his own life. There was a prophecy that Athens would not fall if her king should be killed by the enemy, and Codrus went alone into the Dorian camp and was slain. The invaders were repulsed and the memory of Codrus was ever afterwards held sacred by the Athenians. The kingship was now abolished, we are told, and thereafter the head of the state was the Archon, who was at first chosen for life from the family of Codrus; but later the Archon was elected for ten years.

The Athenian Oligarchy. — Before the close of the eighth century the government had become an oligarchy (government by a few), in which all power was confined to a few noble families called the Eupat'ridae. They alone had the right to sit in the Areop'agus or national council and to become archons. These latter officers were nine in number and chosen each year by the council, which retained complete control over them. The mass of the people who were not nobles had no political rights.

Such a system is always liable to abuse, and in Athens it worked very badly. The nobles oppressed the people, and the state was torn by factions. There was always a large body of men whose wrongs made them ready to join conspiracies or follow the lead of demagogues. The city was governed less by law than by the caprice of the nobles, and the people could not tell what punishment was attached to an offense. This latter grievance finally became so intolerable that the nobles were forced to consent to the drawing up and publication of a

code of laws fixing definitely the penalties for crimes. The work was intrusted to the archon Draco (621 B.C.), who imposed such cruel punishments for offenses that a later Athenian writer declared that his laws seemed to be written in blood.

Solon. — The laws of Draco did not put an end to factional strife. There were frequent popular outbreaks, and the city was approaching a state of anarchy. The condition of the debtor class presented a serious problem. The poor tenants on the estates of the Eupatridae had fallen greatly into arrears with their rent, owing to several years of bad harvests, and by the laws of Draco were liable to be sold into slavery by their landlords. If this were done, it would reduce the entire lower class in Athens to the position of slaves; and since that class was numerous, it seemed likely that it would break out in rebellion rather than submit.

At this crisis an Athenian noble named Solon was chosen as a mediator. Solon had won the respect of all classes for his wisdom and for the courage and skill he had shown in a war with the neighboring city of Megara. Being a man of high character and patriotism, he did his best to bring about permanent harmony between the different classes. First he came to the rescue of debtors by canceling all debts and making the land the property of those who had formerly worked in the capacity of mere serfs or villeins. He relaxed the severity of all the old laws of Draco; checked the arbitrary power which parents exerted over their children; improved the coinage; encouraged trade, and tried in every way to promote the prosperity of the city. Still more important were the changes which he made in the system of government.

The Constitution of Solon. — In his governmental changes it was Solon's object to check the oppression of the nobles, while still leaving the power chiefly in their hands. He made wealth and not birth the qualification for holding office, dividing society into four classes according to the amount of landed property possessed by the citizens. The archons were to be chosen only from the first or richest class, while the fourth or

poorest class was wholly excluded from office. As the nobles were apt to be rich, this plan still left them the ruling class, but their power was held in check by certain changes made in the forms of government. As a result of these changes the Athenian *demos*, or people, came to have a voice in public affairs, and a long step was taken in the direction of that democratic or popular form of government for which Athens was afterwards distinguished.

The Tyrants. — The government of many of the Greek cities passed through the stage which they called a *tyranny*. Some ambitious man, finding the people ready to revolt against the aristocracy, would assume the leadership, overthrow the rulers, and with the consent of the people make himself the sole governor. He was called a *tyrant*, but the word was not used in the bad sense at present attaching to it; it merely meant a man who had assumed absolute power. Oftentimes he governed wisely and well. For example, the tyrants of the city of Sicyon (670–570 B.C.) were frequently mild as well as able rulers. On the other hand, many of these arbitrary rulers were bitterly hated, like Periander of Corinth (625–585 B.C.), who practiced the policy of killing or driving into exile any citizen whose wealth or popularity seemed too great. As everything depended on the personal character of the man who possessed this vast power, the time was sure to come when the office fell to the lot of a ruler too weak or too unpopular to keep it; so tyrannies were never permanent.

Tyranny in Athens. — Athens had its experience of tyranny in common with the other cities of Greece. Solon's reforms brought peace to the state for a little while, but soon the different factions fell to quarreling again. The old lawgiver lived long enough to see all his work undone and a tyranny established in place of his carefully planned constitution. When he died in 558 B.C., his own kinsman Pisis'tratus was ruling as tyrant of Athens. Pisistratus governed mildly and dealt so gently with his enemies that they were able to form a combination against him and drive him from the throne. This happened twice, and

after his second expulsion it was ten years before he regained his power. When restored to the throne for the third time, he governed more strictly, but still with wisdom and moderation. He kept Athens at peace with other states, and spent the public money on the improvement and adornment of the city. He made his court a gathering place for literary men from all parts of Greece.

On his death in 527 B.C. he was succeeded by his sons Hip'prias and Hippar'chus, who at first governed well. Hipparchus, however, soon got into trouble. Having a private grudge against a citizen named Harmo'dius, he publicly insulted the latter's sister. Harmodius with his intimate friend Aristogiton determined to kill both tyrants. They formed a conspiracy and planned to carry out their purpose on the occasion of a public festival. They succeeded in killing only Hipparchus. Harmodius was cut down at once by the guards and Aristogiton was put to death with torture soon afterwards by the surviving tyrant. Hippias now became cruel and suspicious, and his rule was so harsh that in 511 B.C. he was driven out by the aid of the Spartans, and the republic was restored. Thus the Athenian tyranny came to an end and the credit for its overthrow was given to Harmodius and Aristogiton, who, although their deed was merely an act of private revenge, were long regarded as the patriotic restorers of the city's liberty.

The Reforms of Clisthenes.—After the expulsion of the tyrants, the aristocratic and popular parties fell to fighting for the control of affairs. The leader of the popular or democratic party was Clis'thenes, who, being a man of singular ability, not only succeeded in suppressing the aristocrats, but effected changes in the constitution of Athens which proved to be of the utmost importance. He really transformed the state into a pure democracy. He admitted all the free inhabitants of Attica to citizenship. Both the Senate or Boule (*Boo'lay*) and the Popular Assembly or Eccle'sia were increased in numbers, but the latter was increased in power as well. It not only

received foreign ambassadors, decided questions relating to foreign affairs, and required magistrates to give an account of their conduct while in office, but it could pass new laws and change the constitution, and exercise full authority in matters of taxation and revenue. Any citizen could rise and address the assembly, a right which was freely exercised and perhaps accounts for that almost universal taste for oratory which characterized the Athenian people.

Ostracism. — A peculiar feature of the constitution established by Clisthenes was the right of ostracism, that is, of banishing any citizen whose presence in the city seemed likely to cause a political disturbance or interfere with good government. A special meeting was held, and if 6000 votes were cast for expulsion, the citizen voted against was obliged to go into exile for ten years. The term 'ostracism' is derived from the Greek word *os'trakon*, a shell, the votes being written upon shells and placed in the ballot box. The resort to it was merely a matter of political expediency and did not necessarily imply that the person against whom it was used had done anything deserving of punishment. Men of excellent character were sometimes banished in this way, but their property was not confiscated, and when they returned they were restored to all their rights. Party strife was the bane of Athenian political life, and it sometimes happened that a party leader, however honest and worthy he might be personally, was a source of danger to the state. But after all ostracism was a severe measure and liable to fail in its object. By the close of the fifth century B.C. it had fallen into disuse.

Effects of the Reforms of Clisthenes. — By this constitution the body of free citizens gained the real control of affairs, and Athens became the most democratic city of Greece. The century that followed the introduction of these reforms in 508 was the most flourishing period in Athenian history. This may not have been wholly due to the changes in the government, but it is probable that they aroused the patriotism and civic pride of the people, and it is certain that in commerce, in war,

literature, and art Athens began almost at once to show surprising energy and in a few years held the foremost place among Greek cities. In less than twenty years from the adoption of the constitution of Clisthenes, she stood forth as the champion of Greece against the Persians and won the great battle of Mar'athon.

CHAPTER XIII

THE SECOND PERIOD: THE FLOURISHING ERA

THE PERSIAN WARS

The Greeks in Asia Minor. — Before the close of the sixth century B.C. the Persian Empire was firmly established in Asia Minor. The Greek colonists there had first fallen under the

dominion of Lydia, and when that state was merged in the Persian Empire as a result of the conquests of Cyrus the Great, the Greeks became dependents of the Persian monarch. Darius organized the administration in a very efficient manner, dividing the country into provinces or satrapies, the governors of which were wholly under his control. The Greek cities found the rule of these governors oppressive. Moreover, one of the chief characteristics of the Greeks was a disposition to resent interference with their local affairs. Each city wished to govern itself, and this local patriotism was so strong that Greece always remained a collection of independent cities or states. Only the consciousness of common danger could draw them into a union in which the interests of the individual communities were subordinated to the welfare of the whole league.

Revolt of the Ionian Cities. — Such a common danger was threatening the Ionian cities in Asia Minor in the reign of Darius. In 500 B.C. they broke out in revolt. Knowing that unaided they were no match for the vast armies of Persia, they appealed to their kinsmen in Greece proper. Sparta refused to aid them; Athens sent a small fleet to their assistance. With these allies the colonists attacked and burned the city of Sardis in Lydia; but after this the Athenians gave no more aid. Darius, enraged at the burning of Sardis, carried on the war with vigor, and in 495 B.C. captured and destroyed Mile'tus, the chief city of the rebels. This ended the revolt. Its failure was due chiefly to the local selfishness of the Greek communities, which were always slow to act in a common cause, each being intent on its own advantage and regardless of others if its own affairs were going well.

Invasion of Greece. — Having taught the Greeks of Asia Minor the folly of revolt, Darius determined to bring their kinsmen in Greece to the same condition of dependence. He sent an expedition under his general Mardo'nius, but the fleet was wrecked on the rocky coast of Mt. Ath'os and the land forces were checked by the savage tribes of the north. Nothing daunted, he resolved on another expedition against Greece.

He was especially angry at the insolence of Athens in having sent aid to his rebellious subjects in Asia Minor, but he now gave her, as well as the other cities of Greece, the chance of peaceful submission. In accordance with the Persian custom he sent heralds to all the cities, demanding the gift of earth and water in token of their complete submission to the authority of the great king. The heralds were received in a way to make him still more angry. The Athenians threw one of them into a pit and told him to take earth from there, and in Sparta the demand for water was answered by hurling the herald into a well.

No pains were spared to make the second expedition successful. A year and a half was spent in preparations, and the army is said to have numbered 310,000 and the fleet to have contained 600 galleys.

Battle of Marathon (490 B.C.).—The plain of Marathon, about six miles long and two wide, lies on the shore of the bay of the same name and is shut off from the interior of Attica by the foothills of Mount Pentel'icus. In this bay a large number of the Persian ships were anchored while their army was encamped near the shore. Against this great force the Athenians were able to muster about 10,000 heavy-armed soldiers; for of all the cities of Greece the little town of Platae'a alone sent them aid. Sparta, being in the midst of a religious festival, refused to act till five days had passed, and her troops arrived too late for the battle.

The Persian and Athenian forces faced each other for several days, the latter occupying the slopes of the hills. Finally Milti'ades, the leader of the Athenians, sounded the advance. His troops, running down the slope to the Persian lines, struck them with such force that they were almost immediately thrown into confusion. It was an easy victory for the Athenians, who lost less than 200 heavy-armed soldiers, while the Persians lost 6400 and left seven of their ships in the hands of the conquerors. The rest of the Persian army escaped in the fleet.

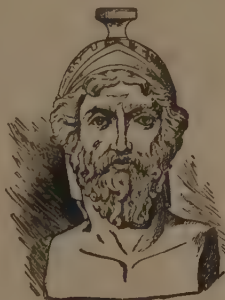

In the meanwhile traitors had been busy at Athens, and at this moment they signaled the Persians that the city lay open

to attack. Miltiades, however, saw the signal and, guessing what it meant, hurried off his army to Athens; and by the time the Persians came, he was there with his army, ready for another battle. Completely disheartened, the Persians dared not land. They gave up their expedition and returned to Asia.

Effects of the Victory. — Thus in the year 490 B.C. the Athenians had shown their ability to defend the cause of Greek independence against the greatest power in the world. The battle of Marathon was not remarkable in point of generalship or of the numbers slain. Its importance is in its moral effects. The victory came as a surprise to both Greeks and Persians. Hitherto the Persians had seemed invincible, and for the Greeks they had the utmost contempt. The latter had gone into the battle as a forlorn hope. They came out of it with the consciousness of not only having beaten their enemy, but of having beaten him against tremendous odds.

Miltiades. — The chief credit of it all belongs to Miltiades. But for his courage, the Athenians would have shut themselves up in their city and stood a siege; and it was the stimulus of his heroism that nerved his little army to the victory of Marathon. And the people of Athens fully appreciated what he had done. No man was more popular in the city and none had more honors bestowed upon him. His greatness, however, was of the sort that only great crises call forth. When peace returned, he showed himself selfish and even dishonorable. Securing an armament from the city under false representations, he used it to gratify a private grudge against the people of Paros. He laid siege to their capital, was unsuccessful, and returned in disgrace. He was put on trial, convicted, and fined, but died a few days afterwards.

Darius. — Darius, the Persian king, survived the defeat of his great army only about four years. Had he lived longer, he

MILTIADES

would have renewed the war; for his determination to destroy Athens was only strengthened by reverses. As it was, he left the execution of this policy to his successor, Xerxes. It was a lucky thing for the Greeks that it happened so; for Xerxes and his successors were men far inferior in ability to the old king. They were mere despots, while Darius was a far-sighted and skillful statesman.

The Years 490-480 B.C. — It was ten years before the Persians renewed their attacks, and in the meanwhile Athens had another war on her hands — one of those profitless conflicts between neighboring states that occurred too often in Grecian history. This time it was the inhabitants of the island of Aegi'na that the Athenians were fighting. The war is important from its effect on the naval policy of Athens. The strong fleet of the Aegine'tans enabled them to hold out against Athens for several years, till finally the Athenians became exasperated and determined to build a navy that should crush their enemy once and for all. This policy was urged by Themis'tocles, but there was a strong party, headed by Aristi'des, who opposed it, partly on the score of expense, but more especially because they thought that the strength of the state should be in its land forces, and because they feared that a powerful navy would tempt to foreign conquest and lead to endless wars. Party spirit ran high, and at last the people had recourse to the expedient of ostracism. Aristides was ostracized and Themistocles had things his own way. Two hundred new vessels were built. As it turned out, this was fortunate. Already the rumor of a new invasion by the Persians had been brought to Greece.

The Preparations of Xerxes. — The work begun by Darius was continued by his successor Xerxes, but the latter determined that this time he would make failure impossible by raising such an army as the world had never seen. In this he succeeded. All the nations subject to the vast Persian Empire sent troops, and it was probably the most motley throng ever gathered under a single leader. According to some accounts,

it numbered 5,000,000, and the lowest estimates place it at 800,000, a figure probably nearer the truth. And the fleet was equally formidable. It is said to have comprised 1200 war vessels. To facilitate the march of the army into Greece, Xerxes had a bridge of boats built across the Hellespont, and to avoid the risk of damage to his fleet in rounding the headland of Mount Athos, he had a canal cut through the isthmus that connected the promontory with the mainland. These things done, the army and fleet advanced on Greece.

The Defense of Thermopylae (480 B.C.).—The Pass of Thermopylae is a narrow strip of land lying between the Malian Gulf and one of the offshoots of Mount Oeta. Two miles across in some places, it contracts to a width of a few yards about midway. It was at this narrow point that the Greeks decided to take their stand against the Persian army. Yet only a small force was sent to defend the pass. Leonidas, the Spartan king, at the head of 300 Spartans, with their Helots, 700 Thespians, and other allies, amounting in all to about 10,000 men, undertook to block the path of the Persians. With a part of his forces he encamped in the pass; the rest he stationed on a height several miles inland to guard a path which led to the rear of his position.

Xerxes, despising the small force that he learned was holding the pass, sent a messenger to command them to give up their arms. "Come and take them," was Leonidas' reply. The king waited a while to give the Greeks a chance to come to their senses, and then sent a body of his troops with orders to capture them and bring them before him. To his great chagrin, this body was beaten back with loss. He next called out the famous 'Immortals,' a chosen band of 10,000, the finest troops in the Persian army, but in fighting at close quarters in the narrow pass they fared no better than the others. For two whole days the Persians tried in vain to break through the Greek line. The check was complete; the whole Persian army came to a standstill.

At this crisis a Greek traitor told the king of the round-

about path over the mountains and, in return for money, offered to guide the Persian army to a point in the pass behind the army of Leonidas. The offer was accepted, and a Persian force passing over the mountains dislodged the Greek guards stationed there and suddenly appeared in the rear of the force in the pass. The latter were thus hemmed in by vastly superior forces. Their cause was hopeless; but Leonidas was a Spartan and took the Spartan view of military duty. He allowed his allies to retire, but the 700 Thespians chose to remain. In the death struggle of this little band hundreds of Persians were killed, and even after Leonidas had fallen and only a few of his followers were left, the Persians did not dare to fight hand to hand. They stood at a distance and showered the Greeks with arrows till all were killed.

Though one of the most famous battles in history, the defense of Thermopylae was not important in its immediate effects. The Greeks did not hear at first how a handful of their countrymen had held the whole Persian army in check. They knew merely that a Greek force had been cut to pieces in the pass. And the loss to the Persians, though heavy, did not amount to much for so large an army. The chief result of Thermopylae was to give the Persians a very exalted idea of Greek valor. Xerxes judged the other Greeks by those who had held his army at bay in the pass. Thenceforth the Persians never showed the same confidence in fighting them. They thought they were all like Leonidas—a far too favorable estimate, and one that proved of much profit to the Greeks.

The Battle of Salamis (480 B.C.).—The Persian and Greek fleets met first off Cape Artemisium, where several indecisive battles were fought; but when the news came that the Persians had gained the Pass of Thermopylae, the Greek fleet was obliged to retreat. Still, there was some encouragement in the fact that the enemy had lost heavily by storm. It now seemed hopeless to the Greeks to check the advance of the land forces of the Persians, and it was decided to abandon

Athens and stake everything on a naval battle. Superstition pointed to this course; for the oracle of Delphi had declared that the only safety to the Athenians lay in their "wooden walls," which the ingenious Themistocles construed as meaning their ships. So when the Persians reached Athens, they found the city deserted by all save a few desperate citizens. They captured the city without difficulty, and burnt it down in plain sight of the Greek fleet which was lying near by in the narrow waters between the island of Salamis and the Attic coast.

Themistocles, the admiral of the Athenian fleet, was bent on awaiting the Persian fleet and bringing on a battle at this point. The Peloponnesian admirals wanted to retreat westward and take their stand at the Isthmus of Corinth, leaving central Greece to its fate. Themistocles succeeded by a stratagem. He sent word secretly to Xerxes that the Greek fleet was preparing to retreat, and that if the king wanted to capture it, he must send ships to both entrances of the bay. Accordingly, on the next day the Greeks found themselves surrounded, and a battle was unavoidable.

Despite the loss through shipwreck, the Persian fleet numbered about 1000 ships, while the Greek contained only 380; but in seamanship and courage the Greeks were far superior. Xerxes, sitting on the rocky height looking over the bay, saw the whole combat. The issue was doubtful at first. Each side fought bravely. After a while it was seen that the Persians suffered the heavier losses. They began to lose courage, and as the panic grew they fell into confusion and suffered rather than gained by their excess of numbers; for their ships became huddled together and impeded action. The Persian admiral, a brother of Xerxes, was killed while trying to board an Athenian vessel, and about nightfall the Persian ships began to fall back. By the close of the day the Persians had lost 200 ships and the Greeks 40, and though the former still remained superior in numbers, they had become completely demoralized. The Persian fleet was soon hastening back to Asia.

The Battles of Plataea and Mycale (479 B.C.).—Xerxes apparently lost all hope after the battle of Salamis. He returned to Asia, but left 300,000 of his best troops under his general Mardonius to winter in Thessaly and complete the subjugation of Greece in the following spring. By that time, however, the Greeks had gathered an army 100,000 strong and were ready to meet him. The battle took place at Plataea. It was a strange, irregular fight, in which the Greeks owed their victory to their heavy armor and better fighting qualities, rather than to superior generalship. Losing only about 1300 of their own troops, they almost totally destroyed the Persian army. On the same day the Greeks won a naval battle off Mycale, on the coast of Asia Minor.

The effects of the battles of Salamis, Plataea, and Mycale were decisive. Salamis demonstrated the naval superiority of the Greeks, and sent the king, the fleet, and the larger part of the Persian army in full retreat. Plataea was followed immediately by the submission of all the allies of the Persians throughout Greece; and Mycale secured at once the independence of the Ionian subjects of the Persian king, for all the islands and many of the Greek cities of Asia Minor at once asserted their freedom. Thus the king had not only failed to subdue Greece, but actually lost a large part of one of his own provinces.

CHAPTER XIV

ATHENS AT THE HEIGHT OF HER POWER

Themistocles. — Without the Athenian navy, these successes against the Persians would have been impossible. Themistocles had done more than any one else to make Athens a great naval power, and it was he, too, who had the wisdom and the courage to force a battle at the right time. The main credit for the result of the war belonged to him, but he was not long allowed to enjoy his honors. His success made him many enemies and rivals, and what was worse, his own faults gave color to their accusations against him. He was an open taker of bribes. His old foe Aristides, who had returned to Athens and regained the popular confidence, taunted him with not having "clean hands." The people became disgusted with his corrupt practices and tired of hearing him boast of the services that he had rendered. Again recourse was had to ostracism, and this time Themistocles was the victim. He left Athens, and later falling under suspicion of treason became so generally hated that he had to leave Greece. He fled to the Persian country, where he was received with favor and made the governor of a province. Here he remained till his death, about 460 B.C.

By some it was believed that he committed suicide. His career proves him to have been possessed of remarkable political sagacity and strength of will; but the means which he employed to gain his ends were often unscrupulous, and his motives were selfish. He aimed to make himself the greatest man in Greece, but his success was transitory.

The Naval Power of Athens. — After the fall of his rival, Aristides was for several years the most influential man at Athens; but he no longer opposed the building of a strong navy. In fact, it was he who, by bringing about the important Confederacy of Delos, led to the establishment of the maritime empire of Athens. This confederacy arose from a temporary alliance of Athens with the Ionian cities to carry on

the war until all Greeks, whether in Greece proper or in Asia Minor, were free from the domination of the Persians. The Spartans, too, sent a contingent of ships; and the Spartan general Pausanias, who had commanded at Plataea, was at first the admiral of the allied fleet; but his insolence and treachery led to a mutiny, and the fleet chose as its commanders the Athenian admirals Aristides and Cimon. This was just after the fleet had captured Byzantium (Constantinople), a Greek city which held out for the Persians. The Spartans

THE PIRAEUS OR HARBOR OF ATHENS

now withdrew their ships, but Aristides concluded treaties with the Ionian cities for the joint prosecution of the war. Under Athenian leadership the war continued till its object was realized and the Greeks of Asia Minor had gained their freedom. The Confederacy of Delos had been formed to accomplish this one thing. Nevertheless, the Confederacy continued in force, Athens refusing to let its members withdraw. She became in reality the head of a league, and received money from the other members. Her naval power was greatly strengthened, and under the leadership of her able commander Cimon she won many victories and made herself the greatest maritime state of Greece.

Pericles and Cimon. — Cimon inclined toward the aristocratic or conservative party and favored a policy of friendliness toward Sparta. Pericles, though he belonged to an old and wealthy family, was a champion of the democracy. Acting on the advice of Cimon, the Athenians sent a force to aid Sparta in putting down a revolt of the Messenians and Helots; but it accomplished nothing and was treated by the Spartans with marked discourtesy. This brought Cimon into disfavor and he was banished (461 B.C.); but his banishment did not last long, for the Athenians were defeated by the Spartans in the battle of Tan'agra (457 B.C.), and, thinking it wise to forget all party differences in the presence of danger, they recalled Cimon. For several years Athens was involved in wars, which, though marked by occasional successes, did not result in any great gain.

ATHENS IN THE TIME OF PERICLES

Cimon died in 449 B.C., and thenceforth, for many years, Pericles controlled the affairs of the city. For a short time he directed the campaigns against the neighboring states with which Athens was at war; but he soon saw that permanent conquests in Greece were impossible and his policy was

mainly one of peace. He concluded the so-called Thirty Years' Peace with Sparta in 445 B.C. It was not destined to last for more than fourteen years, but this was a sufficient interval to enable Pericles to introduce many reforms and greatly to improve the city. This period marks the highest point of the prosperity of Athens, as well as the acme of the power of the great statesman whose name has been applied to this epoch in Athenian history.

The Age of Pericles. — The interval of about fifty years between the close of the Persian and the beginning of the Peloponnesian war has been called the Age of Pericles, — a somewhat misleading term, as Pericles was at the head of Athenian affairs for only twenty years (449–429 B.C.). But he was the most brilliant statesman that Athens produced during that period, and his work is so closely identified with the greatness of the city that it is not strange that his name has been given to the period.

PERICLES

Soon after the battle of Salamis, Athens reached the height of her power. She aspired to be the ruling state of northern and central Greece, just as Sparta was the leading state of the Peloponnesus; but her conquests by land did not prove enduring, and it was chiefly as a sea power that she possessed strength. She had the greatest maritime empire of all Greece. During the fourteen years of peace that preceded the outbreak of the Peloponnesian war, Pericles introduced many democratic reforms into the constitution. Some of these were of doubtful value. While they educated the great body of the citizens in political matters, so that it was said that the humblest Athenian was fit to hold office, they led to confusion, vacillation, and other evils which became apparent after the great influence of Pericles was withdrawn.

It was during this period that the Par'thenon and several other of the finest structures on the Acropolis were built —

buildings which are still models of architectural beauty. The frieze running around the outside of the Parthenon and containing a vast number of sculptured figures representing a

INTERIOR OF THE PARTHENON

religious procession was the work of Phid'ias, the most renowned sculptor of ancient Greece. Athens was the resort of learned and talented men from the whole Hellenic world. This was the age of the tragic masterpieces of Aes'chylus, Soph'ocles, and Eurip'ides, and of the comedies of Aristoph'anes.

The period marks not only the highest point of Athenian power, but the climax of Greek art.

CHAPTER XV

THE PELOPONNESIAN WAR

Causes of the War.—The real cause of the Peloponnesian War was the jealousy felt by the other Greek states at the leadership of Athens. In time of danger the Greek cities might forget their local differences, but with the return of peace, all the old love of independence asserted itself. Athens retained the supremacy which she had gained for herself during the Persian wars. She remained the head of the Delian Confederacy and applied the contributions of members to her own uses. Many of the fine sculptures and buildings with which Pericles adorned the city were paid for out of these common funds.

There was another thing which raised up enemies for Athens. She stood for the democratic principle. Not only was her own constitution thoroughly democratic, but her influence was always exerted in favor of the democratic party in other states. Sparta, on the other hand, was as invariably the champion of

the opposite principle. It was natural that the oligarchical or aristocratic cities should look to Sparta for protection, while the democratic communities ranged themselves under the leadership of Athens.

The occasion of the war was the aid rendered by Athens to Corey'ra in a conflict between the latter and Corinth, of which Coreyra was a colony. Corinth appealed to Sparta for aid. This was granted, and Athens soon found herself opposed by a formidable league of Greek states with Sparta at the head. In 431 B.C. hostilities began.

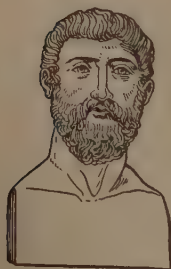

The First Ten Years, 431-421 B.C. — The strength of Athens lay in her fleet; that of her enemies in their land forces. During the first period of the war the contestants were fairly well matched, but Athens suffered from a deadly visitation of the plague, which carried off thousands of her citizens and among them Pericles (429 B.C.). The death of Pericles deprived the city of the only man who was fit to direct her affairs. New leaders arose, but they lacked his influence and ability and could not repress party strife.

Cleon was the leader of the democracy and Nic'ias of the more conservative party. The former won a victory at the island of Sphacte'ria, which he took by storm, capturing some 300 Spartans, but he was defeated soon afterwards in a battle at Amphip'olis. This and other calamities gave the aristocratic party the control of affairs, and its leader Nicias concluded a truce with Sparta. The truce of Nicias (421 B.C.) was to last fifty years, and both parties agreed to restore their conquests and prisoners. Thus all these years of fighting, with its waste of life and treasure, had brought little advantage to either side. To the Athenians it should have proved the wisdom of a policy of self-defense. This was the policy which Pericles had favored, but as later events will show, they departed from it with disastrous results. These years had also shown that Athens would do well to confine herself exclusively to naval warfare. Her land expeditions were almost always failures.

The Sicilian Expedition (415-413 B.C.).—In spite of the truce of Nicias, there was no real interval of peace; for though the truce was partially observed for a period of seven years, Athens and Sparta were continually trying to injure each other. Athens joined an alliance of Peloponnesian states against Sparta in 419 B.C., and in the battle of Mantinea in the following year the Spartans gained a victory over the army of the allies, which included a contingent of several hundred Athenian troops.

At this time one of the political leaders in Athens was the young Alcibiades, a man of unusual talents, but selfish and unscrupulous. Believing that he had more to gain from war than from peace, he did all he could to bring about a renewal of the conflict. It was largely his influence which induced the Athenians to undertake the ill-fated Sicilian expedition for the purpose of conquering Syracuse, and, if successful, of asserting supremacy over all Sicily. This was certain to stir the jealousy of Sparta and cause a renewal of the war.

Moreover, Athens had not recovered from the effects of the previous years of fighting, and could ill afford this drain upon her resources.

ALCIBIADES

It was one of the largest expeditions that ever set out from a Greek city, comprising 134 vessels and a considerable land force. The three generals in command were Alcibiades, Nicias, and Lamachus, but Alcibiades was soon recalled on a charge of impiety. Fearing to face his accusers, he went to Sparta and did what he could to injure his

native city. Nicias, who had long opposed the expedition, carried it out in a dilatory and unskillful way. Although reinforced by a considerable body of men under the brave and skillful general Demosthenes, the Athenians were wholly unsuccessful. They were beaten in a sea fight in the harbor of Syracuse, driven ashore, and obliged to burn such of their

vessels as had not been sunk or captured. Then followed a desperate attempt to retreat by land through the enemy's country. The whole force was cut to pieces or captured, and the generals were taken prisoners and killed. This was the worst disaster that had ever befallen Athens.

The Close of the War. — Before the close of the Sicilian expedition, the war had broken out again in Greece; for the Spartans had sent aid to Syracuse and contributed to the defeat of the Athenians there. In revenge Athens sent a fleet to ravage the Laconian coast (414 B.C.), but the city was weakened by the strife of factions. Alcibiades was recalled, and for a time Athens was victorious on sea; but Lysander, the Spartan admiral, won a battle, and Alcibiades, who had not been present at the engagement, fell into disfavor and was deposed from his command. Another victory which Lysander gained at Aegospotami (405 B.C.) decided the war. He took by surprise a large force of Athenian soldiers and sailors, killing many and taking 3000 prisoners. The aristocratic party in Athens was favorable to Sparta and in the following year, 404 B.C., the city surrendered.

This was the end of the Peloponnesian War. It reduced Athens to the rank of a second-rate power and completely destroyed her maritime strength. All that remained of her navy was a fleet of twelve ships which she retained by permission of her conquerors. She was given up to the rule of the aristocratic party, and for some time was governed by the so-called 'Thirty Tyrants,' who allowed a Spartan garrison to occupy the citadel and drove from the city all who opposed their plans.

CHAPTER XVI

THE SPARTAN AND THEBAN SUPREMACY

The Retreat of the Ten Thousand.—The downfall of the Thirty Tyrants in Athens was accompanied by civil strife and the city was given over to anarchy; but the democratic party finally triumphed and peace was restored. Athens did not regain her former supremacy. The leadership in Greece had passed over to Sparta.

But Athens was still the center of art and learning, and among her citizens were the foremost men of Greece. The greatest of these was Socrates, the wisest of philosophers and the best of men. His teachings and conversation as recorded in the writings of his pupils show the highest moral purpose reinforced by the keenest logic; but his fearless attacks on evil doers made him many enemies. He was brought to trial on a trumped-up charge of corrupting the youth of Athens, and condemned to take poison (399 B.C.).

His pupil Xenophon was famous as an author and as a general. His *Anabasis* is a graphic account of an expedition of the Greeks against the Persian king Artaxerxes. Cyrus the Younger, the brother of Artaxerxes, revolted against him and called in the aid of 10,000 Greek mercenaries. With these allies he gained a complete victory at Cunaxa, in the very heart of the Persian country, but lost his life in the battle. After his death the Persian troops in his army went over to Artaxerxes, and the Greeks were left to find their way home as best they might. Their generals were tricked into an interview with the Persian leaders and all murdered; but the Greeks chose as their new general Xenophon, who had accompanied the expedition as a private soldier, and under his able leadership they at last found their way through a hostile country and amid the greatest hardships to the seacoast. Xenophon's account of the upward journey and the retreat is one of the masterpieces of historical writing.

Sparta. — The period of Sparta's supremacy was brief and troubled. It lasted from the close of the Peloponnesian War in 404 B.C. to the defeat of the Spartans at Leuctra in 371 B.C. Within five years from the victory at Aegospotami Sparta was involved in a war with the Persians, who were trying to bring the Greek cities of Asia Minor again under their rule. Under their king Agesila'us, the Spartans were victorious in Asia Minor, and at one time seemed on the point of overthrowing the Persian Empire; but the Persian king saved his throne by stirring up jealousy among the states of Greece, and Sparta soon had her hands full in dealing with her enemies at home.

The Thebans, aided by the Corinthians and Argives, made war upon her. Athens, too, joined the allies, and the supremacy of Sparta was seriously threatened in spite of her victories on land. Athens gained a naval victory at Cnidus and strengthened herself by an alliance with the Persian king, but at last, in 387 B.C., Sparta made peace with Persia, giving up to the latter all the Greek cities of Asia Minor. By these means she secured the friendship of the Persian king and reëstablished her power in Greece; but by surrendering the Asiatic Greeks to Persian tyranny, she forfeited all claim to respect as a champion of Grecian liberty against Oriental despotism.

Thebes. — Sparta abused her power in Greece. It has been said before that the weight of her influence was always thrown on the side of the oligarchical or aristocratic party in the other Greek cities. Acting on this policy, she interfered in the affairs of Thebes and in concert with the aristocratic party there seized the citadel and set up a tyranny. The Thebans suffered this oppression for three years, then formed a conspiracy, assassinated the tyrants, and drove out the Spartans (379 B.C.).

The leaders in the movement for Theban independence were the two friends Pelop'idas and Epaminon'das, both brave men and ardent patriots. Epaminondas especially deserves his title to renown for his high and unselfish character, and his ability both as a general and a statesman. He has been compared to our own Washington. Under these two

leaders Thebes entered on a long war with Sparta, in the course of which her soldiers showed the utmost valor and steadfastness. It was closed by the decisive battle of Leuctra (371 B.C.), in which Epaminondas won a complete victory over the Spartans.

Sparta now fell from her supreme position in Greece, and Thebes took her place. For nine years Thebes remained the foremost city of Greece, but she owed her power to the statesmanlike qualities of her great liberator, Epaminondas. In 362 B.C. he fought another battle with the Spartans at Mantinea, but fell at the moment of victory. After this the power of Thebes declined.

Results of the Wars. — Peace was now restored, but it was the result of exhaustion rather than of genuine reconciliation. Jealousies and bickerings continued between the cities. It was a time of weakness and disunion, and the way was open for the rise of a new power which should hold the rival communities in subjection to a common tyranny.

The Theban Victories of Leuctra (371 B.C.) and Mantinea (362 B.C.). Decline of Theban Power. — Results of the Wars.

CHAPTER XVII

THE THIRD PERIOD: THE MACEDONIAN SUPREMACY

The Macedonians. — The most flourishing period of Greek history was the time of local independence, when each city was free to manage its own affairs in its own way. Unfor-

tunately, the cities fell to fighting among themselves and became so weak as a result of the continued conflicts that they could not ward off attacks from without. To the north of Greece proper lay the country of the Macedonians, a semi-barbarous but hardy and warlike people, whose king, Philip, saw that the time had come for extending his power over his kinsmen in the south and building up an empire of which his kingdom should be the head.

He began by interfering in the disputes between the Greek states, and by a free use of money bought the friendship of many who had opposed his designs. He provided himself with a well-drilled standing army and conquered the western part of Thrace. He next waged a war on behalf of the sacred temple at Delphi, and being successful in this, posed as a religious champion of the Greeks. The way lay open to leadership in Greece, but in the Athenian orator Demosthenes he found a vigorous opponent of his schemes.

Demosthenes. — Seeing clearly that Philip was aiming at the subjugation of Athens along with the other cities of Greece, Demosthenes determined to oppose him. Some of the speeches of Demosthenes have come down to us and show his remarkable talent for persuasive speaking. He is placed among the foremost orators of ancient and modern times. All the powers of his oratory were directed against Philip in a series of famous speeches called the *Philippics*, with the design of exposing the Macedonian schemes and uniting all Greece in resisting them. At first they were all in vain. The Greek states would not unite because they were corrupted by Macedonian gold. Nevertheless, Demosthenes finally formed an alliance against Philip between Athens and Thebes, and these two cities sent troops against him; but the allies were beaten in the battle of Chaeronea in 338 B.C. This decided the fate of the Greek cities. They had to admit the supremacy of Macedonia.

Alexander the Great. — Philip enjoyed the leadership in Greece for only a short time. He was assassinated two years after his victory at Chaeronea, leaving the throne to his son

Alexander, who was then only twenty years old, but had already given proof of remarkable military genius. Alexander was the greatest general that Greece ever produced. He was not only wonderfully skilled in military tactics, but he knew the art of organizing and maintaining the most efficient army that up to that time had ever been seen. The peculiar feature of this force was the *phalanx*, which consisted of foot soldiers armed with long spears and drawn up in ranks at such a short distance from each other that the spears of the men behind projected beyond the men in the rank in front, thus presenting the appearance of a thick impassable hedge of spear points. In a charge a force thus disposed proved especially effective.

Alexander was recognized as the general of all Greece on the death of Philip, and he soon made it clear that in spite of his youth he was quite able to enforce his authority. A rebellion having broken out when he was absent on a campaign against the barbarians of the north, he returned to Greece, suppressed the revolt at once, and punished with great severity those who had taken part in it. With Greece at his feet, he was now free to carry out his scheme of foreign conquest. This was at first directed against the Persian Empire, but his ambition, increasing with each success, finally aimed at nothing less than the conquest of the whole world. He left Greece, never to return.

The Conquest of Persia. — With a small but splendidly equipped and disciplined force, Alexander crossed the Hellespont into Asia Minor and passed on to the river Grani'cus. Here the way was blocked by a Persian army, but he inflicted upon it such a crushing defeat that almost all of Asia Minor submitted to him at once.

Marching on into Syria, he encountered at Issus, near the borders of that province and Cilicia, a vast Persian army commanded by the king, Darius III., in person. Alexander's victory at Issus was equally decisive, resulting in the capture of the Persian camp and treasures and the family of the king. All the western part of the Persian king's dominions was now under the control of the conqueror.

Egypt was next invaded and in a short time was completely subdued. Here Alexander founded the city of Alexandria, which in later times became one of the greatest centers of Greek culture in the West. Alexander now followed the fugitive king into the heart of his empire. Darius made his final stand in the plains of Gaugame'la, not far from the village of Arbe'la, which has given its name to the battle. He led an army estimated at twenty times the strength of the invaders; but the old superiority of the Greek over the Asiatic soldier was again demonstrated. Alexander was completely successful (331 B.C.). This was the deathblow to the Persian Empire.

Alexander

Darius

THE BATTLE OF ISSUS

(From an old Mosaic)

The king managed to escape, but was assassinated soon afterwards. The great cities of Persia submitted to Alexander, who was now, at twenty-five years of age, the master of western Asia.

The Invasion of India. — Curiosity as well as the greed of conquest tempted Alexander to penetrate the great empire to the east. The Greeks had heard wonderful tales of its wealth, but of the real nature of the country they knew nothing. Alexander led his army down the right bank of the Indus, repulsing with

little difficulty the attacks of the natives until he reached the Hydaspes (Jhelum) River. There he fought a battle with the Indian king Porus. The Greeks gained the day, but lost more heavily than when they defeated the vast armies of Darius at Arbela and Issus.

Alexander subdued a large part of northern India, and would have carried his conquests further but for the mutiny of his troops. When he reached the river Hyph'asis, his Macedonian

soldiers declared they would not go a step further. This was the limit of his conquests. He returned to Persia by a new route, passing down the Indus to its mouth and thence to Persia by way of what is now Beluchistan. On the return journey the main body took the usual road, but Alexander with a chosen band passed through an unexplored region and three fourths of his force died on the way. He reached Susa in the spring of 325 B.C.

Death of Alexander. — It was plainly Alexander's purpose to form his European and Asiatic dominions into a single empire, of which he should be the sole and absolute despot. Since his conquest of Persia, he had assumed the style of an Oriental

monarch, and his arrogance and vanity were so great as to offend many of his Macedonian followers. Before he went to India, he showed all the violence and cruelty of a tyrant whose head had been completely turned by success. In a drunken fury he killed his friend Clitus, who had saved his life at the battle of the Granicus. To be sure, Alexander repented of this on coming to his senses, but he did not give up his drinking bouts or show moderation in his government. When he returned from his Indian expedition, he planned to make Babylon his capital; but he fell a victim to a fever contracted in the surrounding marshes, which, aggravated by his continual excesses, caused his death in 323 B.C., at the age of thirty-three, after winning for himself the fame of one of the world's greatest generals. He had proved himself able to conquer a wider domain than any one before him, but he did not possess the highest qualities of a statesman. The great empire that he founded fell to pieces after his death. Nevertheless, his conquests had one lasting result; they spread the Greek civilization at least in some degree throughout the world.

The Successors of Alexander. — After Alexander's death, his successors fell to fighting among themselves, each striving to gain for himself a large slice of the divided empire. Finally, as a result of the battle of Ipsus in 301 B.C., the empire was divided into three parts under separate rulers: Egypt, Macedonia, and Syria.

Egypt. — In the partition of the empire, the throne of Egypt fell to the share of Ptol'emy Lagi, an energetic and able ruler, the first of a long line of kings who also bore the name of Ptolemy. Alexander had transferred the capital from Memphis to Alexandria, and the latter city became a great center of Greek learning. Ptolemy protected the old religion and did no violence to the customs of the natives; but the important offices were filled with Greeks, and the civilization of the country was Greek rather than Egyptian. Ptolemy encouraged learning, began the collection of the great Alexandrine library, and founded the Museum or university which drew students

from all parts of the East. The line of the Ptolemies lasted till the death of Cleopatra in 30 B.C., when Egypt became a Roman province.

Syria. — The kingdom of Syria was founded by Seleucus, whose successors are known as the Seleucidae. Under Seleucus the kingdom extended to the Ganges and Jaxartes rivers and included the best part of the Asiatic empire of Alexander. At first the capital was Babylon, but Seleucus transferred it to Antioch. Under his successor the empire declined and split into fragments, and finally, in 65 B.C., the portion called Syria was conquered by Pompey and became a Roman province.

Macedonia and Greece. — After the death of Alexander several Greek cities, with Athens at their head, tried to regain their liberty; but the attempt failed, and the Macedonians inflicted a heavy penalty on the patriots. Demosthenes was one of the leaders in this revolt and after it was put down took flight, but finding himself pursued, he died by his own hand rather than fall into the power of his enemies.

The Achaean and Aetolian Leagues. — The independent spirit of the Greek cities declined during the third century B.C., and they were willing to renounce some of their individual rights in the attempt to rid themselves of the Macedonian supremacy. This is shown by the formation of the Achaean and Aetolian leagues, which were not unlike the union of the Swiss states in modern times. Each city, while managing its own local affairs, surrendered to the central organ of government the control over external matters, especially the decision of peace and war. The Achaean League, comprising at first ten Achaean cities, included finally the Peloponnesus, with the exception of Sparta. Athens and Aegina also became members. The Aetolian League included several of the cities to the north of the Corinthian Gulf.

Unfortunately, the formation of these leagues did not tend to promote the harmony of the Greek states. They were involved in frequent wars and even fought with each other.

Macedonia, though not retaining her former power, was strong enough to act as an umpire in these conflicts. But the time was now approaching when a greater people than the Macedonians should assert its supremacy over the Greeks. Weakened by these internal wars, Macedonia fell, after a long conflict (200–168 B.C.), under the power of Rome, and after the battle of Pydna, Perseus, the last of the Macedonian rulers, was carried as a captive to Italy.

Greece a Roman Province. — Now that the most powerful of the Greek states had fallen under a foreign tyranny, it might be supposed that the other Greek communities would have maintained peace among themselves and gathered strength to guard against a similar calamity. They did not do this, but continued to fight among themselves as before, and in 146 B.C. the last remnant of Greek liberty was destroyed and Greece became a Roman province under the name of Achæa.

The period of the Macedonian supremacy and of the conflicts of the leagues was, on the whole, a period of declining civilization in Greece. There were still scholars of note, but the original genius of the people seemed to be on the wane. It was not a time that produced great poets or philosophers, and something of Oriental servility and inertness is discernible in the Greeks of this period. Some writers attribute this to the reflex influences of Alexander's Oriental conquests, maintaining that while the Greeks imposed their civilization on the Oriental peoples, they tended to approach the Oriental type themselves.

CHAPTER XVIII

GREEK CIVILIZATION

Religion. — The religion of the Greeks was singularly poetical. They believed in many gods, whom they invested with human qualities and about whom they constructed countless picturesque legends. As time went on, the number of these gods increased, and worship was extended to the heroes of antiquity and to the supposed children of gods and goddesses. The king of the gods was Zeus (corresponding to the Latin Jupiter), from whom all law emanated. He was the source of the orderly principle discernible in the universe, but shared his government with his two brothers, Posei'don (Neptune) and Ha'des (Pluto), the former ruling over the sea, and the latter over the lower world, where the wicked were punished or passed through a period of probation. With Zeus and Posei'don were associated ten other gods and goddesses who dwelt with them on Mount Olympus.¹

¹ The Greek poet Hesiod does not include Pluto or Ha'des among the greater gods, although his power was scarcely inferior to theirs. These greater gods were twelve in number. Besides Zeus and Posei'don there were Apol'lo or Pho'e'bus, the god of poetry and music: Hephaes'tus, the god of fire, corresponding to the Roman Vulcan and represented as a blacksmith; Ar'temis, the counterpart of the Roman Dia'na, the goddess of the chase, and the divinity of the moon; Her'mes, the Roman Mercury, the messenger of the gods and the divinity of eloquence; A'res, the Roman Mars, the god of war; Hera, cor-

Beside these twelve greater gods, there was a host of minor divinities, such as He'lios, the god of the sun, Bacchus, the god of wine, the Muses, the Ne'reïds or Sea Nymphs, the Graces, etc. The Greeks personified fate or destiny in the three sisters called Parcae or Moirae, who were superior even to Zeus himself. They controlled the destinies of man's life, and prayers were unavailing against their absolute power. The Greeks further believed in a principle of justice, or, rather, vengeance, called Nem'esis, which pursued the proud to their ruin and brought the guilty to punishment. These are only a few of the many deities of the Greek religion. It differed at different periods and

HERA (Juno)

at different places. Almost every locality had its guardian deity, every stream its god, and every grove its nymph. Hosts of satyrs, fawns, hamadryades, Nereids, Tritons, and centaurs peopled the world of the imaginative Greeks.

Oracles. — One of the chief features of the religious life of the Greeks was a belief in oracles, of which the most noted were those of Zeus at Dodo'na and of Apollo at Delphi. The sayings of these oracles were regarded by the Greeks as revelations of the divine will. On the occasion of a great national

responding to the Roman Juno, the wife of Zeus; Athe'ne (Minerva), the goddess of wisdom; Aphrodi'te (Venus), the goddess of beauty and love; Deme'ter (Ce'res), the goddess of agriculture; and Hestia (Vesta), the goddess of the hearth.

emergency the Greeks consulted the oracle and shaped their conduct according to its answer. The answer was often framed in words capable of a double construction. For instance, when the Athenians consulted the oracle before the battle of Salamis, as to what was the best course for them to pursue, the oracle replied that they should seek safety in their "wooden walls." This dubious response gave Themistocles a ground for maintaining that the fleet of the Athenians was their only hope of deliverance from threatened conquest by the Persians. There are many instances of these doubtful and unintelligible replies of the oracle; for the priests or priestesses that presided at the shrine were clever enough to invent phrases which were capable of meaning more than one thing.

Festivals and Games.—Another feature of the Greek religious life was the holding of festivals. There were four great national festivals,—the Olym'pic, the Pyth'ian, the Isth'mian, and the Neme'an. The Olympic festival was held every four years in honor of Zeus, in the plain of Olympia in Elis. It was the most famous of all the gatherings of the Greeks. The time at which it was held marked the beginning of the Greek New Year, and the Greeks divided their calendar into four-yearly periods, measuring the interval between these festivals. At these assemblies of the Greeks, contests were held in which prizes were awarded for excellence in athletic exercises, chariot races, music, and poetry. The prize was merely a chaplet of olive or laurel placed on the head of the victor, but his name was proclaimed in all the states of Greece and his return home was signalized by a triumph. These gatherings became the competing grounds for talent in every field. The works of artists, poets, and historians were exhibited and read before their countrymen, and prizes were awarded to the best. These assemblies, by bringing together the people from all parts of Greece for the purpose of friendly contests, tended to make them conscious of the ties of race. During the greater part of Grecian history they were almost the only really national institution.

Literature. — Of all peoples of antiquity the Greeks had the greatest literary gift. The writings of Homer are nearly as familiar to the modern reader as to the ancient Greeks. Another very ancient poet was Hesiod, the author of the *Theogony* and the *Works and Days*, the former describing the origin and history of the numerous gods, and the latter dealing with the daily life of the cultivator of the soil, and containing practical suggestions and moral reflections. Of the lyric poets, one of the most famous is Tyrtaeus, the lame schoolmaster of Athens, who, as the story goes, was sent by his countrymen to Sparta, and by his inspiring battle songs gained victory for the Spartans in the Second Messenian War. The writings of Archilochus, another lyric poet, were regarded by the ancients themselves as nearly equal to those of Homer, but they were of a very different character, being satirical and at times caustic. The poems of Sappho (*Saf'o*) were so valued by her countrymen that she was called by them the "tenth muse." Love was the usual subject of her songs. Alcaeus was another passionate lyric poet, and his verses on love and wine, and war and political subjects were especially admired by the Greeks. Anacreon may be called the poet of pleasure, for his odes are largely given up to the praise of love and wine. Pindar, on the other hand, was a poet of more serious tone. By many he is considered the greatest lyric poet of Greece. Among the poems that have come down to us, are hymns to the gods, choral songs, dirges, songs of victory, and odes celebrating the national games. In tragedy the three great poets, Aeschylus, Sophocles, and Euripides, surpassed all others. Of these, Aeschylus (525–456 B.C.) was the most serious and perhaps the most impressive in style. Seven of his tragedies are extant. They deal with supernatural subjects, such as the anger of the gods, and the exploits of mythical heroes, and in their grandeur and force are perhaps the finest of all the classic tragedies. The style of Sophocles (495–406 B.C.) is more graceful and polished, though less imposing. As in the case of Aeschylus, only seven of his tragedies are extant, but these

include *Ædipus the King*, which was classed by Aristotle as the greatest of all tragedies. Euripides (480–406 B.C.) was more philosophical in spirit than either of the others. He had not their faith in the reality of the gods, the fates, and the furies, and he took his characters more from real life. Eighteen of his plays have been preserved. In comedy Aristophanes (about 450–about 380 B.C.) was the greatest of all the ancient writers. He wrote *The Birds*, *The Clouds*, *The Wasps*, and *The Frogs*, satirizing Athenian society in an amusing manner. In history, as in tragic poetry, three great names overshadow all others. These are Herodotus (484–420 B.C.), Thucydides (471–400 B.C.), and Xenophon (about 445–355 B.C.). Herodotus was a graphic and agreeable writer, but lacked critical discrimination in sifting the true from the false. He was a great traveler and studied the national customs and geography of many lands. Thucydides showed the true historical spirit. He was painstaking and impartial, and his work is written in a clear and spirited style. Xenophon was perhaps more of a memoir-writer than a historian, but his *Anabasis*, already described, proves him a master of historical narrative. In oratory the genius of Demosthenes had no equal, although a talent for public speaking was widely diffused among the Greeks. Aeschines, the famous opponent of Demosthenes, was an eloquent speaker, and the speeches of Pericles and Isocrates are fine oratorical compositions.

Philosophy. — Greece produced philosophers whose writings influenced the world to our own time. Among the early philosophers were Thales, Pythagoras, and Zeno. Socrates, whose death has been recorded in the previous account of the age of Pericles, left no written works, but his teachings were preserved in the writings of his disciples, of whom the most famous was Plato. The philosophy of Plato had a great influence upon all departments of human thought, but its effect upon the world was surpassed by the more practical and logical philosophy of Aristotle (384–322 B.C.). Aristotle's reasoning dominated the minds of men down to the beginning of our

modern age. The scholars of the Middle Ages followed the methods laid down by Aristotle with hardly any deviation.

Grecian Art. — In art the Greeks excelled all the nations of antiquity, and the forms which they designed have remained models to the world for all time. The masterpiece of Grecian architecture was the Parthenon, which has already been described. But there were other temples in great number which showed their marvelous skill in execution and their appreciation of the beautiful. The sculptures of the Greeks remain

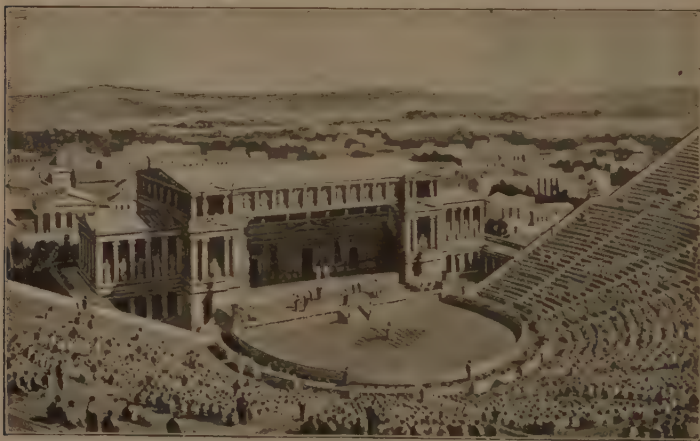

A GRECIAN TEMPLE

to this day as models of artistic perfection. In our own public buildings we see the preservation of the Greek genius in the graceful Ionic column, the highly ornamented Corinthian column, and the severe but imposing Doric style of architecture.

The Theater. — The Greek theater was semicircular in form, with rising tiers of seats. It was usually without a roof, and the stage was provided with little scenery. The theatrical performances grew out of the songs and dances in honor of

Bacchus. A peculiar feature was the chorus, which, in a sort of chant, commented on the actions of the players or narrated parts of the plot. Women were not allowed to appear on the stage. The actors wore masks adapted to the character of the part portrayed, and in comedy these masks were often caricatures of the public men who were being burlesqued. Greek taste would not permit murders to be represented on the stage. The deed was supposed to have been done behind the scenes, and the report of it was brought by a messenger.

A GREEK THEATER, ATHENS

The great dramatists held it beneath the dignity of their calling to write for money. They worked merely for fame. The performance lasted all day, one play following another in quick succession, and meals were eaten in the theater. The actors wore high-heeled shoes and padded their clothes in order to make them look more majestic, for the drama commonly dealt with gods and heroes.

Marriage Customs.—A priest was not necessary to an Athenian marriage, but the favor of the gods was first invoked by suitable offerings. The omens were studied, and if not

favorable the wedding was postponed. The bride was escorted by a procession of friends to her husband's house, where all partook of a wedding banquet. She wore the veil for three days after the wedding.

Burial.—The token of death in a family was a vessel of water placed at the entrance to the house. A curious custom was the placing of a coin in the mouth of the dead to pay the boatman for his passage over the mystic river Styx to Hades. The funerals were often elaborate, bands of mourners and a chorus of hired musicians taking part in the procession. Sometimes the body was buried and sometimes it was burned. When it was burned, the ashes were afterwards collected and placed in an urn of bronze or clay. Sacrifices were offered at the funeral pyre and the grave, and, as among the Egyptians, articles of value or practical use were placed by the side of the dead.

Meals.—A light repast in the early morning was followed by a more substantial meal at noon; but the chief meal was the dinner at the close of the day. The guests reclined at the banquets, and used neither napkins nor knives and forks. The scraps of food left over were thrown under the table and afterward cleared away by slaves. After the substantial courses were finished, the symposium (drinking together) began, the guests being first decorated with garlands. The wine was mixed with water by the chosen ruler of the feast. Music was a feature of the banquet.

Houses.—The house was entered by a corridor opening into a large court surrounded by porticoes. The rooms opening into this court were the apartments of the men. The women's apartments surrounded another large court entered by a second corridor behind the men's apartments. The walls were often beautifully decorated with frescoes and the rooms furnished with articles of graceful and artistic design and costly materials. The first court contained an altar to Zeus, and the second court an altar to Hestia. The rooms were heated by fireplaces or braziers.

Political Life. — The Greeks never rose to the conception of patriotism in the modern sense. Their patriotism consisted in the love for the city, to which they never joined a love for the race. They never developed a national state. Political strife was the curse of their existence. They were intensely local in their spirit, and apparently preferred to sacrifice their liberty to a foreign oppressor rather than merge any of their local privileges in a national Greek organization. They believed in slavery, and even the greatest of their philosophers. Aristotle, argued that the wise and the good had a natural right to make slaves of the foolish and bad. Slavery was a recognized institution among the Greeks, and we must not imagine that to their minds freedom meant the liberty of all men dwelling in a community.

While they surpassed all the nations of antiquity in their philosophy, literature, and art, they lacked political capacity and in the end became the subjects of a foreign power. Superior to the Romans in all things that pertained to culture and refinement, they were, nevertheless, far inferior to them in political energy and common sense. They became the masters of the Romans in literature and art, but their subjects in the domains of law and politics.

ROME

CHAPTER XIX

THE PERIOD OF THE KINGS

Race. — Before the authentic history of Italy begins, the country was inhabited by four races, — the Pelas'gians, the Etrus'cans, the Greeks, and the Italians. The Pelasgians were probably the earliest inhabitants. They were the kinsmen of the people whom we have described under that name in the early history of Greece. The Etruscans held the land of Etruria to the north of the river Tiber. Their origin is unknown, but is thought to have been of great antiquity, and long before Rome was founded they had developed a civilization of their own. Neither they nor the Pelasgians, however, were destined to play an important part in the history of Italy. As to the Greeks, they were colonists sent out from the cities of Greece, and were confined to the southern coast, which, with the island of Sicily, came to be known as Magna Graecia, or Great Greece. The most important race of all was the Italian, which was of Aryan origin and akin to the Greeks. The Greeks and Italians had probably formed a single swarm which left the original home of the Aryan race at a date

ROMAN STANDARD BEARER

long before authentic records begin, and afterwards had divided into two parts, of which one occupied the peninsula of Greece and the other the peninsula of Italy.

The Latins. — The Italians were divided into several tribes, — Latins, Umbrians, Sabines, Samnites, etc., — of which the most

important were the Latins, who lived in Latium, between the river Tiber and the river Liris to the south. There was a long period during which the Italian tribes fought among themselves for the mastery, and at the end of it the Latins proved themselves the strongest. The means by which they accomplished

this are involved in obscurity; for the only account which we have of the history of the period is a mass of legends, full of marvels and unworthy of belief, except in their general outline. The Romans themselves believed them, and as they throw some light on the character of those early times, they are worth our notice.

The Founding of Rome. — The Romans traced their origin directly to the Trojan hero Aene'as, who, after the destruction of his city, went to Italy and founded a kingdom there. The capital of this kingdom was Alba Longa, but about the middle of the eighth century B.C. the twin sons of the god Mars by Rhea Silvia, a virgin priestess, founded the city of Rome. A variety of picturesque myths cluster about Rom'ulus and Remus, the founders of the city. They were said to have been thrown into the Tiber by a usurping king, but to have been cast up on the shore and suckled by a she-wolf. Later they were rescued by a shepherd, who brought them up as his own sons. When they had founded the city, they quarreled, and Romulus, the elder of the twins, killed his brother and named the city Roma (Rome) after himself. The date of this event was 753 B.C., and from this year the Romans dated their calendar.

The Thirty Cities. — As Rome increased in power, Alba Longa began to fear her as a rival. A league of thirty Latin cities was formed, and in this Alba Longa at first held the foremost place, but Rome was remarkable for her stern and warlike energy. By means which are matters of legend rather than of history, she formed an alliance with some of the neighboring cities, and finally grew strong enough to attack Alba Longa. After a long war the latter city was captured, and Rome became supreme among the Latin tribes.

Society and Government. — Rome was intensely aristocratic in spirit. The descendants of the original Romans and of the tribes admitted to an equal footing with them held for themselves all political rights. They constituted the Patric'ian class or nobility; they alone could hold office and control the gov-

ernment. All the others were classified as Plebeians, who, though personally free and possessing the right to hold property, were utterly without political authority. The Senate was

chosen from the patricians, and even the Popular Assembly was made up wholly of that class. This division into classes was of the utmost importance in Roman history. For many years the main interest centers in the conflicts of the two, resulting from the oppressions of the ruling class and the persistent efforts of the plebeians to work their way upward to a position of equal political authority. As

to the form of government, it was a monarchy, and remained so for nearly 250 years from the founding in 753.

The Kings. — According to the legends, the reign of seven kings filled up this period, and the events of each reign are narrated with considerable detail, but can not be taken as historical facts. After Romulus, the founder, came Numa Pompilius, renowned as a peaceful sovereign and a lawgiver. He is reputed to have introduced many important features of the Roman religion, and his wisdom was so great as to give rise to the legend that he was in frequent communion with the nymph Egeria, who taught him divine things.

Tullus Hostilius. — Tullus Hostilius, the next king, was constantly engaged in war. To his reign belongs the well-known story of the combat between the Horatii and the Curiatii. The armies of the rival cities, Rome and Alba Longa, were on the point of joining battle when it was agreed that the contest should be decided by a combat between the Horatii, three brothers in the army of Rome, and the three Curiatii, chosen from the Alban army. Two of the Horatii were killed in the combat, but the survivor managed to engage the victors separately in fight and slew them one by one. When Horatius returned in triumph to the city, his sister, who

was betrothed to one of the Curiatii, overwhelmed him with reproaches and lamentations. Angered by this, he killed her, and was condemned to death for the crime, but his life was spared on account of the great service which he had rendered Rome.

Ancus Marcius. — Like Numa, Ancus Mar'cius was a wise administrator and lawgiver. He was also successful in war, conquering several of the Latin cities, and bringing many of the inhabitants to Rome, where they settled on the Av'entine Hill.

Tarquinius Priscus. — Tarquin'ius Pris'eus was a native of Etruria, who, coming to Rome in the reign of Ancus, soon won the favor of the king, and rose to a high position in the state. On the king's death Tarquinius ascended the throne, the king's children being too young to rule. He built the great sewer or drain (*Cloaca Max'ima*), which still exists, laid out the Circus Maximus, the great public race course, and completed the conquest of Latium. He was murdered by the sons of Ancus, who thought he was planning to deprive them of the succession in favor of Ser'vius Tul'lius, a youth who had been brought up at the palace, and was much loved both by Tarquinius and his wife Tanaquil. Tanaquil, however, concealed the death of her husband long enough for Servius Tullius to secure himself upon the throne.

Servius Tullius. — Under Servius Tullius the plebeians secured a share in the government, on account of a change in the constitution, which made all citizens possessed of a certain amount of property sharers in the government, whether they were patricians or plebeians. From his reign dates a new Assembly called the *Comit'ia Centuria'ta*, or Assembly of the Hundreds, representation in which depended on this new principle of property. In this Assembly patricians and plebeians voted alike, but the older body, called the *Comitia Curia'ta*, in which the patricians alone had the right to vote, still existed.

Tarquinius Superbus. — The last of the kings was Tarquinius Super'bus (534–510 B.C.). He tried to establish a tyranny, and

his rule was so oppressive that not only was he expelled from the kingdom, but he made the kingly form of government so hateful to the Romans that for hundreds of years they could not tolerate even the name of king.

Value of the Legends. — These stories, and a hundred others dealing with the period of the kings, are in their details purely imaginary, but they have a value as national traditions pointing to some historical facts. Thus the legend of Romulus and Remus has as its probable basis the fact that the city was settled by shepherds; but its details, like those of many of the other stories, were borrowed from the Greeks. It is probable, too, that Latium contained many independent communities, of which Alba Longa was the chief; that there were many wars between them, and that Rome conquered them and added greatly to the number of her citizens. Facts of this broad and general nature are doubtless at the bottom of the legends.

CHAPTER XX

THE PERIOD OF PATRICIAN RULE

Periods of History. — From the overthrow of the monarchy to the establishment of the Empire was a period of 482 years. During all this time Rome was under a republican form of government. This long interval may be divided into four periods: first, the Period of Patrician Rule (509–304 B.C.),

during which the plebeians were steadily struggling to assert their rights; second, the Period of the Conquest of Italy (304–266 B.C.); third, the Period of Foreign Conquest, including the wars with Carthage and Macedonia (266–133 B.C.); fourth, the Period of Civil Strife (133 B.C. to the establishment of the Empire in 27 B.C.).

The New Government. — After the kingship was abolished in 509 B.C., the heads of the government were two magistrates called Consuls, elected each year by the *Comitia Centuriata*, the assembly in which, it will be remembered, the plebeians had a right to vote. The first consuls were Brutus and *Collatinus*, of whom the former (known as the ‘elder Brutus’) had taken an active part in the expulsion of the king. The legends represent him to have been a fine example of the stern Roman virtues. His opposition to the king had arisen from a resolve to avenge a grievous wrong which the king’s son had committed. Another story illustrates the rigid manner in which Brutus administered justice. When his own sons were found to have been engaged in a plot to reinstate the king, Brutus refused to pardon them and ordered them to be put to death with the other conspirators.

The Authority of the Consuls. — The power of the consuls was almost as great as that of the king had been; they were the chief magistrates of the state, and they appointed the senators and the officers who had charge of the treasury. In times of special danger one of the consuls might appoint a dictator, with power of life and death during the interval for which he was appointed.

Quarrels between Patricians and Plebeians. — The establishment of the Republic did not improve the political position of the plebeians. All offices of the government were monopolized by the patricians, and what was worse, many of the plebeians having fallen into debt during the long wars became, according to the old Roman law, the slaves of their creditors. Though they had few political privileges, the burden of military service fell chiefly upon the plebeians. Finally, when they

could stand this state of things no longer, the plebeians withdrew from the city to the Sacred Mount, about three miles from Rome, where they declared that they would remain and found a new city (493 B.C.). This brought the patricians to terms, and it was agreed that two officers, called Tribunes of the people, should be chosen from the plebeians. The persons of these officers, who were to hold office for a year, were sacred, and they could annul by a simple veto any act of the consuls which they thought oppressive to the common people. Further than this, the debts of the poor plebeians were canceled.

The Comitia Tributa. — Another gain for the popular party which was secured some years after was the institution of the Assembly of Tribes (*Comitia Tributa*), in which the plebeians alone had the right to vote. This body chose the tribunes and afterwards secured other rights. From this time on the plebeians steadily increased in power, securing one important privilege after another.

The Decemvirs and the Twelve Tables. — Down to the middle of the fifth century B.C., there was no regular code of laws; but finally it was decided that ten men, chosen from both patricians and plebeians, should prepare a code of laws and in the meanwhile exercise complete control over the government. These decem'virs framed the famous code known as the Twelve Tables, which were the basis of all later legislation. It was decided to continue this form of government for another year, but the decemvirs for the next year governed in an arbitrary way and the plebeians again withdrew to the Sacred Mount. The decemvirs were forced out of office, and it was at this time that the Comitia Tributa acquired an equal place with the older Assembly of the Hundreds and that the tribunes gained the right to veto an act of the senate.

Later Changes. — The consular offices were still closed to the plebeians, but soon after the struggle over the decemvirate a law was passed creating the new office of Military Tribunes, who were chosen from both plebeians and patricians and were to have the power of consuls. For several years the attention

of the Roman citizens was taken up with wars, but before the fourth century had far advanced the political strife was renewed. In 367 B.C. the so-called Licinian Laws were passed, which marked another great step in the upward movement of the plebeians. These laws provided for the relief of material want by canceling the debts of the poor and by forbidding the concentration of land in the hands of a single person beyond a certain limit. They also decreed that one of the two consuls must be chosen from the plebeians. There was a long struggle between the two classes before these changes went into effect, but it resulted in a complete victory for the plebeians; all the offices were thrown open to them, and by the close of the fourth century B.C. political equality was secured.

Wars. — From the establishment of the Republic to the close of the fourth century, Rome was engaged in frequent wars, the chief of which were: first, the wars with the Ae'quians and the Vol'scians; second, war with the Etruscans; third, war with Veii (*Vay'ee*); fourth, the repulse of the Gauls; and fifth the wars with the Samnites and Latins. As these struggles really led up to the first conquest of Italy, they are described in the next chapter.

CHAPTER XXI

THE CONQUEST OF ITALY

War with the Volscians and Aequians. — While Rome was weakened by internal conflicts of the social classes, her enemies, the Aequians and the Volscians, began to encroach upon her. The story of the wars which followed is a mere matter

ROMAN FOOT SOLDIER

of tradition. There is a legend that a patrician named Coriola'nus proposed that the grain which had been procured with some difficulty in a time of famine should not be distributed among the plebeians unless they would agree to give up the Tribune. So great was the outcry against this proposal that Coriolanus was obliged to leave the city. In his resentment he went over to the Volscians and led their armies against Rome; and, it is said, with such success that he soon had

the city at his mercy. All supplications were in vain until his mother and wife joined in entreating him to spare the city. He then gave way, and, telling his mother that she had saved Rome but lost her son, led the Volscian army back.

Another story relates to the war with the Aequians. For some time they had been successful against Rome, and finally seemed on the point of taking the city. In these straits the Senate sent messengers to Cincinna'tus, a patrician who had formerly held the offices of senator and consul. Roman historians illustrate the simplicity of their hero by citing the fact that the messengers found him plowing on his farm. He responded to the call, and, becoming dictator, drove back the enemy and rescued the state. Having accomplished this in a little more than two weeks, he gave up his office and returned to the plow.

The War with the Etruscans and Capture of Veii. — Some historians believe that before the beginning of authentic history Rome formed a part of a great Etruscan empire, and that she won her independence with great difficulty. However this may be, it is certain that the two races became involved in war early in the fifth century B.C., the Etruscans having held certain towns on the Roman side of the river Tiber. These wars lasted many years, and finally the Etruscan town of Veii became the center of the conflict. The Romans laid siege to this town for ten years, and in 396 B.C. it was captured by the dictator Camil'lus. After this many of the other Etruscan towns fell under the power of Rome.

The Gallic Invasion (390 B.C.). — The Gauls were a Celtic race dwelling in southern France and northern Italy. While the Etruscan wars were going on, these barbarians pressed down into Italy and were soon advancing on Rome. A great battle was fought between them and the Romans near the river Allia, about eleven miles north of the city, and the invaders were completely victorious. The Roman army was panic-stricken and the people fled in despair across the Tiber. Some escaped to Veii, but the greater part were slain. A handful of men, however, remained in Rome and undertook to save the capitol. Under their chief, Brennus, the Gauls poured into the city, plundered and burned the temple, and murdered the aged senators, who, according to the legend, were sitting silent in the Forum, clad in their robes of state.

Another story tells how the Gauls, having found a path up to the capitol, planned a night attack, but the cackling of geese awoke the defenders just in time to repulse the attack. Then

GALLIC HORSEMEN

the Gauls settled down to the policy of starving out the little garrison, but finally offered to retire on condition of receiving 1000 pounds in gold. According to the legend, when the Romans complained that the weights of the scales in which the gold was being weighed were false, Brennus cast his sword into the balance, exclaiming, "Woe to the conquered;" but at this very moment Camillus, who had gathered an army from the fugitives, appeared in the city and scattered the insolent barbarians in flight. Whatever may be the foundation of these tales, it is certain that the Gauls left Rome.

After the withdrawal of the Gauls, the Romans returned to find the city in ruins, but they set about the task of rebuilding with such energy that in a short time the damage was repaired. Legend connects the name of the patrician Manlius with the defense of the citadel against the Gauls, and it is said that after this brave deed he took up the cause of the plebeians and tried to relieve the debtor class. This roused the bitter enmity of the men of his own rank. When attacked by the patricians, he withdrew to the Capitoline hill with a band of followers and tried to defend himself. It was all in vain. He was seized and condemned to death, being thrown from the Tarpeian Rock, a cliff on the side of the Capitoline hill where traitors were executed.

The First Samnite War. — The details of the First Samnite War, begun in 343 B.C., are given by the historian Liv'y, but are very dubious. The Romans, according to his account, were victorious in three great battles and made peace only because they were afraid of an attack from their Latin allies.

The War with the Latins. — When the Romans incorporated another tribe within their state, they did not admit them to the same privileges as the original Roman citizens. In fact, the whole struggle between the patricians and plebeians sprang in the first instance from the difference in race. The patricians were the descendants of the original tribes, while the plebeians were the descendants of those other tribes which were

afterwards incorporated in the state, but were not admitted to the same position of authority as the original Romans. Even though a member of an incorporated tribe was of noble birth in his own city, he became merely a plebeian in Rome. So the revolt of the Latin states which broke out in 340 B.C. was of the same nature as the struggles already described between the patricians and the plebeians. The Latins demanded an equal share in the public offices of Rome and an equal distribution of the spoils of conquests. Finding their demands unheeded, they refused to recognize Rome any longer as the head of the league. It was a very formidable revolt, but the Romans were in the end successful. A famous battle was fought near Vesuvius, at which, according to the legend, the general Decius Mus saved the Roman army at the cost of his own life. Another victory was won at Trifa'nium, and the league of the cities was dissolved. They lost even such privileges as they had formerly possessed, they were not allowed to govern themselves, and the inhabitants of the Latin cities were required to come to Rome for the purchase and sale of goods. They had not the right to vote, and the law forbade the inhabitants of different cities to intermarry or to trade with one another.

The Second Samnite War (326-304 B.C.).— This war arose from the encroachment of the Romans on Samnite territory. It really meant the conquest of Italy for the successful contestant. It is remarkable for one of the most serious reverses that ever befell a Roman army. In the famous Caudine Pass, or Caudine Forks, in 321 B.C., a Roman army was ambuscaded by the Samnites and obliged to surrender. The victorious Samnites were now joined by the Etruscans, and it looked for a moment as if Rome would be overthrown by the allies; but in 310 B.C. the Romans won a decided victory over the Etruscans on the shores of the Vadimonian Lake, and a few years later the capital of the Samnites fell into the hands of the Romans and peace was restored.

The Third Samnite War (298-290 B.C.).— The peace did not

last long. The Samnites formed a powerful league, having as their allies the Umbrians, Etruscans, and Gauls. More than all that, they were joined in the south by Apulians, Lucanians, and Greeks. It seemed like a simultaneous uprising on the part of all Italy to shake off the Roman yoke. The war was decided at Senti'num, 295 B.C., where the Samnites and their allies were defeated, and though the contest was kept up for several years longer, in the end the Romans won the day.

Pyrrhus. — In 282 B.C., after a victory over the Gauls and Etruscans, the Romans had but one formidable enemy to block their way in their attempt to conquer all of Italy. Rome had made herself supreme in central Italy, and it now remained for her to conquer the Greek cities of the southern part of the peninsula. The excuse for the conflict was an alleged insult offered by the inhabitants of Taren'tum to an ambassador from Rome. Both cities delayed awhile before coming to blows; but Tarentum finally called in the aid of Pyrrhus, King of Epirus. Pyrrhus was an adventurous and brave soldier, and his fame had already spread to Italy. In the first battle, at Heracle'a, the Romans were defeated, chiefly, it is said, on account of a new and strange mode

of fighting which Pyrrhus for the first time employed. He employed elephants to give to his troops an advantage in hurling missiles and to crush down the opposing ranks. Nevertheless, his victory was so dearly bought that he is said to have declared afterwards, "Another such victory and I must return to Epirus alone." He always admitted openly the fine discipline which his enemies displayed. Pyrrhus was again victorious in 279 at As'culum, but his loss was very heavy.

After this the Romans gained a brief respite on account of the absence of Pyrrhus for two years on an expedition in aid of

his Greek countrymen in Sicily, who had been attacked by the Carthaginians. He was worsted in his Sicilian contest, but returned to Italy and renewed the fight with the Romans. This time he was completely routed at Beneven'tum (274 B.C.). After this he returned to Epirus and died in 272 B.C. This success established the Roman supremacy over the whole peninsula of Italy, south of the river Ru'bicon.

The Roman State. — With the establishment of Roman domination over Italy, it is important to notice the nature of the government and to ascertain whether or not the newly conquered people received the rights of Roman citizens. The real ruling power in the Roman state was the people of Rome; that is, the comparatively small number of persons who were centered in the districts to the north and south of the Tiber, comprising the Roman territory proper.

“The Roman domination in Italy was a domination of a city over cities.” In Rome itself all citizens enjoyed the same rights. A Roman could marry into the families of all other citizens irrespective of their birth or social standing, and had the right to hold and bequeath property and purchase and sell goods. He had also the right of suffrage and of holding office. In the conquered towns it was different. To some cities Rome gave the right of personal citizenship; that is to say, when any inhabitant of these cities visited Rome, he became in fact a Roman citizen. To other cities Rome granted a full measure of private rights and withheld all public rights; that is, the right to vote and to be elected to office.

There were other towns called colonies, which were formed by the cession of lands to the poorer classes in Rome, and there were still others called prefectures, the government of which was in the hands of a prefect, who was appointed at Rome. The most favored cities were those which were called the allies of Rome. These appointed their own chief magistrates and governed themselves, though their inhabitants did not have the right of Roman citizenship. Rome reserved for herself the right of making peace or declaring war, of receiv-

ing embassies, and of coining money. Special privileges were sometimes granted to the conquered cities under the name of the Latin franchise, so called because it was first originally held by the citizens of Latium. This did not confer citizenship, but made it easy to obtain it.

CHAPTER XXII

FOREIGN CONQUESTS

Character of the Period. — By 266 B.C. Rome held sway over all Italy south of the Rubicon. For more than a century and a quarter after this she was engaged in foreign wars. The most important of these wars was the conflict with the Carthaginians, which lasted until the destruction of Carthage in 146 B.C. The other great foreign war that Rome had on her hands during this period was the war with the Greeks, which closed almost at the same time as the Carthaginian War, and resulted in the reduction of Greece to the position of a Roman province.

The Carthaginians. — Carthage was a colony of the Phoeni-

cians, and inheriting the commercial genius of the race from which she sprang, she soon became the most important maritime power of the Mediterranean. It was natural that the two great states on opposite shores of the Mediterranean should come into conflict. Each was desirous of extending its empire. Of the two, Carthage had the advantage on sea, for she had a powerful navy, while Rome owed her strength merely to the prowess of her land forces.

The immediate cause of the conflict between Rome and Carthage was the seizure of the town of Messa'na in Sicily by a body of Campanian mercenaries called Mam'ertines or Sons of Mars, who were afterwards attacked by the king of Syracuse and appealed to the Romans for aid. The Carthaginians were the allies of the Syracusans in the war with these Campanian troops, and thus the Romans were involved in war with the Carthaginians. The Romans had no real grievance against the Carthaginians, but they were bent on foreign conquest and were glad of an opportunity to measure their strength with their rivals.

The First Punic or Carthaginian War (264-241 B.C.).—Early in the war the Romans captured Agrigen'tum; but though successful on land, they were greatly inferior to the Carthaginians on sea. With extraordinary energy, however, the Romans built a fleet, using as their model, it is said, a Carthaginian vessel which was stranded on the Italian coast. With this hastily constructed fleet the Romans encountered the Carthaginians and, as might have been expected, were defeated; but afterwards they won an important naval victory at Mylae, and soon after this they gained possession of almost all Sicily. Rome now decided to dispatch an expedition against Africa. The fleet in which this expedition set out met a Carthaginian fleet at Ec'nomus, and defeated it. The Carthaginians now sued for peace, but the terms were so hard that they rejected them, and, gathering an army, fell upon the Romans (who had by this time landed on the shores of Africa), defeated them, and captured their general Reg'ulus in 255 B.C.

Rome now equipped another fleet, but after some success it was destroyed by storm. The war was then confined to Sicily, where the Carthaginians suffered a severe defeat near the town of Panormus on the island (251 B.C.). After this the Romans lost heavily by sea until, under their general Cat'ulus, they won a victory over the Carthaginians at the Aega'tes Islands near Lilybae'um (241 B.C.). The Carthaginians now made peace, agreeing to the terms which the Romans imposed.

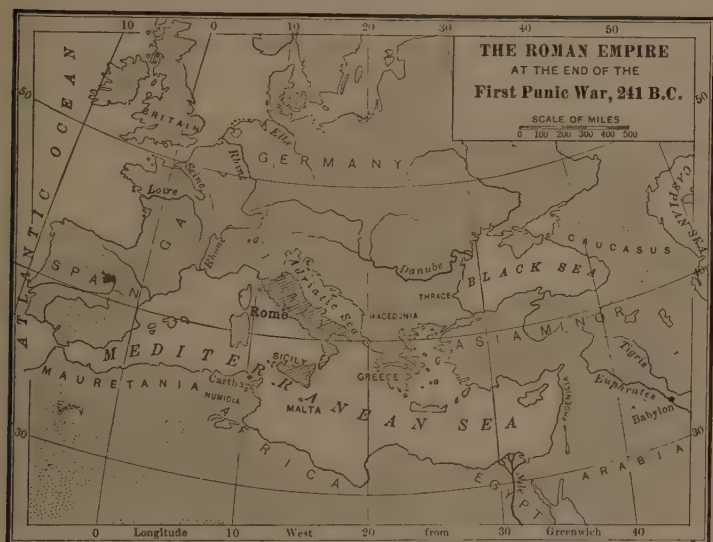

A ROMAN WAR SHIP

They paid a considerable sum of money to Rome, gave up their claim to Italy and the neighboring small islands, and permitted the Romans to form the western part of Sicily into a province. This brought the First Punic War to a close in 241 B.C.

An interesting story is told of the fate of Regulus, which, though doubtful as history, is of value as showing the ideas of the ancient Romans in regard to honor and the value of a promise. It is said that Regulus was sent out from Carthage after his capture in company with Carthaginian ambassadors to sue for peace from Rome. Before he left Carthage he promised to come back and endure whatever penalty the Car-

thaginians chose to impose upon him. The embassy was unsuccessful. The Carthaginians naturally thought that to save himself he would advise Rome to conclude peace. Instead of this, he advised his countrymen to continue the war and in his strict regard for the fulfillment of his promise, returned to

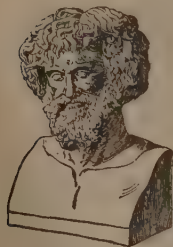

Carthage to suffer the punishment which was the lot of prisoners of war. According to the legend, he received this punishment in full, being put to death with tortures.

The Second Punic War (218-202 B.C.).—In the interval between the First and Second Punic Wars, Rome acquired the northern part of Italy, known as Cisalpine Gaul, sending three successive armies against the barbarians of that region and completely defeating them. In the meanwhile the Carthaginians, who were dissatisfied with the treaty that had concluded the previous war with Rome, had tried to make up for the loss of Sicily by conquering southern Spain. Under their

general, Hamilcar Barca, they succeeded in this enterprise, and turned southern Spain into a dependency of Carthage.

The genius of Hamilcar was inherited by his son Hannibal, whom his father had obliged to swear eternal enmity to Rome. Hannibal completed the schemes of his father, and established the Carthaginian empire in Spain. At the age of twenty-six he assumed the command of the entire Carthaginian army in the Spanish peninsula, and soon afterwards captured the city of Saguntum, which was an ally of Rome. This caused Rome to declare war, and the conflict which followed was known as the Second Punic War, beginning in 218 B.C. and ending in 202 B.C.

Hannibal's Passage of the Alps. — Hannibal determined to carry the war into Italy. To do this, he had to fight his way through Spain and cross the Alps, which were regarded as an impassable barrier between Italy and the North. In this he succeeded, although he lost one half of his troops and almost all the beasts of burden in the passage. This is justly regarded as one of the greatest military feats in history. In modern times Napoleon accomplished it, but both he and his historians have accounted it one of the best proofs of his genius, that he, in the nineteenth century, should be able to do what Hannibal had accomplished in the third century B.C. Hannibal crossed the Alps probably by way of what is now known as the Little St. Bernard Pass. The Gauls on the Italian side of the Alps welcomed him as their deliverer, and he was soon in the plains of northern Italy.

HANNIBAL

Hannibal in Italy. — The Romans were taken wholly by surprise by Hannibal's appearance in Italy. They sent an army against him under Cornelius Scipio, and the two forces met near the river Tici'nus, a northern branch of the river Po. The Romans were routed and soon afterwards suffered another defeat at the river Trebia. In the following year, 217 B.C..

Hannibal won another victory at Lake Trasume'nus. These successes opened the way to Rome, and Hannibal seemed on the point of destroying forever the Roman power. But he thought it was better to make sure of success by winning over the tribes of eastern Italy to his side and opening communications with the Carthaginians. Accordingly he marched toward the south, and did not direct his course toward Rome.

The Romans now chose as their general Quintus Fabius Maximus, whom they made dictator. The policy of Fabius was one of delay. He is known in Roman history as the 'Delayer' (*Cunctator*). He dared not risk an open fight with the great general, but contented himself with harassing his army and wearing him out by delay. Fabius persisted in this in spite of all efforts on the part of Hannibal to draw him into an engagement. The wisdom of this course was soon apparent; for when the Romans actually did venture to fight the Carthaginians on the field of Cannae (216 B.C.), they suffered one of the most serious losses they had ever experienced, and their defeat was complete. Up to this time there had been much discontent with the policy of Fabius at Rome, but after the news of the battle of Cannae the people began to trust him. Many of Rome's allies remained loyal, and in spite of the success of the invader she was still able to resist him.

Whether Hannibal could have destroyed his enemy by a march on Rome has always remained a disputed question. Apparently he did not think it was possible, and he contented himself with the capture of the second city of the peninsula, that is, Cap'ua. Here he and his army spent the winter, and it is said that his troops were weakened by the vices and indulgences to which they were tempted in this luxurious town.

The Romans in Africa. — Realizing the impossibility of dislodging Hannibal from their own country, the Romans finally determined to carry the war into Africa. In Italy, however, they gained some success. They won a victory over Hannibal in 215 B.C., and in 211 B.C. captured the city of Capua. The hero of the African campaign was Publius Cornelius

Scipio, whose first efforts were directed to driving out the Carthaginians from Spain. This he accomplished, and although a Carthaginian army was able to leave Spain for Italy, it was defeated by the Romans in 207 B.C. Having driven out the Carthaginians from the Spanish peninsula, Scipio returned to Rome and was appointed to the office of consul in 205 B.C. He now determined to invade Africa. Landing on the coast, he

was joined by the king of Numidia, and with the troops of the latter as his allies marched against the Carthaginians. Hannibal was now recalled to Carthage, and led the army that opposed the march of the invading Romans. The two armies met at Zama in 202 B.C., and at last the Romans defeated Hannibal.

Result of the Second Punic War.—Carthage was obliged to consent to very hard terms. She gave up to Rome all her possessions in Spain, together with the islands in the Mediterranean, and promised to pay an annual tribute for the term of

fifty years and to destroy all but a few of her ships of war. This victory won for Scipio the title of *Africa'nus* and secured for him one of the finest triumphs that a Roman general had ever received.

Hannibal and Scipio. — In spite of the great services that Hannibal had rendered his country, he was extremely unpopular after his defeat. He was obliged to leave Carthage and seek refuge in Asia Minor, but it seemed as if he could find no corner of the world in which he was safe from the Roman thirst for vengeance. Finally, after he had taken refuge in Bithynia, Rome decided that the ruler of that country must give him up. Hannibal, rather than fall into the hands of the Romans, took his own life by drinking poison. The one purpose of his life had been to avenge the insolence of Rome towards his city, and at no time in her history did Rome come so near destruction as during the period of Hannibal's occupation of Italy. To the end, he never relaxed his hatred toward Rome.

Scipio, though victorious, was treated with equal ingratitude by his countrymen. After winning the victory at Zama, he returned to Rome, where he took an active part in the politics of the city. His success as a general had raised up many enemies against him, and he was charged with corruption. He left Rome in disgust and returned to his country seat in Campania, where he died in the same year in which Hannibal's death occurred (183 B.C.).

Conquest of Macedonia and Syria. — At the close of the Second Punic War (202 B.C.), Rome was supreme in the west and was ready to carry her conquests over the eastern countries. First, she became engaged in a war with Philip V., king of Macedonia, on the pretext that Philip had given aid to the Carthaginians. The Greek leagues were anxious to rid themselves of the Macedonian yoke and to join the side of Rome. The Roman general Flamini'nus defeated Philip in the battle of Cynosceph'ala in Thessaly in the year 197 B.C., and the power of Macedonia was broken, Rome succeeding to her place.

The Greek cities found that they had merely exchanged the Macedonian for the Roman supremacy, and soon revolted against Rome, obtaining the aid of Anti'ochus III., king of Syria, who had offended the Romans by sheltering Hannibal after the latter had fled from Carthage. In the battle of Magne'sia the Romans defeated Antiochus and made him give up all his Asiatic possessions, which were formed into a kingdom dependent upon Rome.

Soon after this, war broke out between the Romans and Perseus, the son and successor of the Macedonian king Philip V. The Romans in this war completed the conquest of Macedonia, winning a decisive victory under Lucius Aemi'lius Paulus at Pydna (168 B.C.). After the destruction of the Macedonian monarchy, Rome enjoyed a protectorate over the Greek states, but her government was so unjust and oppressive that the Achaean League revolted. In 146 B.C. the Roman consul Mummius, having invaded Greece, captured the city of Corinth and razed it to the ground. After this Greece became merely a Roman province under the name of Achaea.

The Third Punic War (149-146 B.C.). — Although the Second Punic War had left Carthage in a condition of weakness and humiliation, Rome was in constant dread lest she should regain her former power and again become a rival. Nothing would do but that the city should be destroyed. Every sign of a return of prosperity to Carthage was viewed with jealousy at Rome. The old Roman Cato was especially bitter in his denunciation of Carthage, and wearied the ears of the senators by the incessant repetition of the words, "Carthage must be destroyed." Finally, the Carthaginians took up arms against Masinis'sa, an ally of Rome, who had repeatedly encroached upon the rights of the Carthaginians. Rome chose to regard this as a breach of the treaty which had closed the Second Punic War, and a Roman army was sent to Africa. It was demanded of Carthage that she should surrender her arms and ships of war. This the Carthaginians did, but the Roman demands became more excessive. The Carthaginians were re-

quired to abandon their city, and when they refused to consent to this Rome prepared to lay siege to it.

The defense of the city was conducted with great heroism, the women and children aiding in the work. It is said that the sacred vessels in the temples and the cooking utensils of the dwelling houses were melted down and turned into weapons. At all events, when the Romans attacked the city they found that the inhabitants had somehow managed to arm themselves. The Romans were repulsed at first, but they hemmed in the city by land and sea and after a siege of four years succeeded in taking it. During the last part of the siege the Roman general was Scipio the Younger, the adopted son of Scipio, the conqueror of Hannibal. The city was completely destroyed by fire in spite of Scipio's wish to preserve it; for the Roman Senate was relentless and demanded that not a trace of Carthage should be left. So complete was the work of destruction that for centuries the site of Carthage was uncertain, and it was only in recent times that its remains were excavated. They were found to be covered with a layer of ashes and to contain many bits of iron, probably fragments of weapons used in the siege. Only a tenth of the inhabitants had survived the siege, and these were sold into slavery. There is hardly a parallel in history to this sudden and complete extinction of an empire.

Roman Conquests. — Although the conquests of Greece and Carthage were the principal events of this period, Rome had other wars on her hands and spread her empire over a wide extent of territory, both in the East and in the West. At the beginning of the period in 266 B.C., her empire was limited to the peninsula of Italy. At the close of it she ruled southern Europe from the Black Sea to the Atlantic Ocean, and a large part of northern Africa. Thus the basin of the Mediterranean Sea was completely under her influence, and besides this she was the dominant power in Asia Minor.

In Spain, where Scipio had such success before Hannibal was recalled from Italy, Rome had some difficulty in repress

ing the spirit of freedom among the native tribes. There was a war of nine years, from 149 B.C. to 140 B.C., with the Lusitanians, who inhabited the modern Portugal, and the Romans were successful only after the chief of the repulsed tribe, Viriathus, had been assassinated. Another long war followed, between 143 and 133 B.C., with the Celtiberians, whose capital city was Numantia, but after varying fortunes the war closed with the capture of this city by the Romans under the leadership of Scipio the Younger, the conqueror of Carthage.

Effects of the Conquests. — The conquered territory was formed into provinces, which were commanded by officers sent out from Rome. These provinces retained their own laws and customs, but were completely subject to Rome, and were obliged to pay an annual tribute. This tribute or tax was collected by a class called publicans, who engaged to pay in a certain amount to the Roman treasury, but were to keep for themselves all that they raised in excess of this amount. This practice gave rise to great oppression and injustice, for a greedy publican would be apt to extort more money from the natives than they could justly be required to pay. But in spite of this difficult system of collecting taxes, a vast amount of wealth poured constantly into the Roman treasury. One result of this was that it enabled Rome to carry out a great system of public works. Italy had become a perfect network of military roads, which remain to this day models of the art of road building; and the public buildings of Rome, its sewers, aqueducts, and bridges, are among the most splendid works of antiquity.

Another result of this wealth was to corrupt the independent and industrious spirit of the Roman citizens. There was a great increase of luxury and of display. The incentive to industry was removed; men looked less to their own exertions than to the spoils of conquest for the acquisition of wealth. Slavery became far more generally practiced than before. Most of the large plantations were worked by slaves, of whom the number was greatly increased by the foreign wars. The

independent Roman cultivator of the soil disappeared, and the work was largely done by slave labor. Moreover, there was a constantly increasing class of people in the city who looked

ROMAN AQUEDUCT NEAR NÎMES, IN FRANCE

to the state for their support. To satisfy the demands of this class and possibly to prevent a dangerous uprising, the government permitted the giving of largesses or the public distribution of alms on a very extensive scale. This was naturally an encouragement of the very evil it was supposed to check.

Another effect of the conquest was to bring Rome into contact with foreign civilizations. The effect of Greek culture on Rome was especially marked, and there was a host of Greek scholars, tragedians, rhetoricians, schoolmasters, and philosophers in the city. Formerly the old narrow provincial spirit of Rome had despised the culture of the Greeks, and some of her ablest men continued to abuse it as certain to induce Greek effeminacy. Nevertheless, Greek literature and art became more and more fashionable at Rome,

ANCIENT ROMAN PLOW

and there is scarcely a Roman writer of note who does not bear traces of their influence.

CHAPTER XXIII

THE PERIOD OF CIVIL STRIFE

133–27 B.C.

Social Condition. — In the last half of the second century B.C., Rome was in a wretched condition. All power was in the hands of the wealthy classes, and the number of the poor was continually increasing. Slave labor had supplanted the work of the

honest Roman peasant. A few aristocratic families held all the public lands and great crowds of people swarmed in the cities, especially in Rome, and subsisted for the most part on the money paid for their votes. A poor man found it hard to earn a living, and he became far too dependent upon the public distribution of bread for his support.

The Gracchi. — It will be remembered that the Licinian Laws regulated the amount of public land which could be held by a single citizen. In spite of these laws, members of the wealthy classes held a far larger amount of the land than was legally permissible. Stirred by the sufferings of the lower classes, Tibe'rius Gracchus proposed a law to limit the amount of land which a single citizen could hold and to distribute the rest among the poorer classes in small homesteads. This law was passed by the people. At this time Gracchus held the office of tribune, and in order to carry the law into effect it was necessary that he should be reëlected. The wealthy classes opposed this, and when his name came up for reëlection, they gathered a mob, fell upon him and his adherents, and murdered him and 300 of his followers (133 B.C.).

Ten years later Gaius Gracchus, the younger brother of Tiberius, took up the cause of the people and secured the passage of an Agrarian Law and of a law for the sale of grain at less than cost to all citizens who might choose to apply for it. He also demanded other important reforms, and, among them, the granting of the right of voting to the Latins and even to the Italians. Like Tiberius Gracchus, he was a tribune of the people; but in 121 B.C. he lost his position and in a riot which followed was killed by the party of the nobles, together with about 3000 of his adherents.

Such was the fate of the Gracchi. They were sincere men, striving to improve the condition of the poor people of Rome; but to the aristocratic party they seemed too radical, and they were sacrificed to the fury of their enemies.

War with Jugurtha. — For a few years after the death of the Gracchi, Rome enjoyed peace, but the ruling class was corrupt

and the administration of the government was marked by extravagance. In 111 B.C. the city was involved in a war with Jugurtha, the adopted son of the king of Numidia. Jugurtha, being ambitious of power, had killed one of the king's sons, who was the rightful heir to the throne. Another son applied to Rome for aid. Rome interfered on behalf of the rightful successor of their ally, but Jugurtha by judicious bribes escaped punishment and ruled the kingdom. A Roman army was sent against him, but he bribed the general and the expedition amounted to nothing. Finally the anger of all the people led to the appointment of Quintus Metellus as general, and he defeated Jugurtha in 108 B.C. Then the command of the army was transferred to Gaius Marius, and the latter brought the war to an end, conquering the African chief, who was brought as a prisoner to Rome. Thus Marius secured a triumph and became the idol of the popular party at Rome. His glory was shared by one of his officers, Lucius Cornelius Sulla, who afterwards became the rival of Marius and the leader of the aristocratic party.

The Cimbri and Teutones. — The Cimbri and Teutones were two great hordes of barbarians, numbering, according to some accounts, about 300,000 fighting men who had left their home in the Alpine regions to the north of Italy and, after conquering the Gauls, actually threatened Italy. Several Roman armies were sent against them and defeated, and the barbarians in 103 B.C. planned to subdue Italy. The popular party attributed the defeats of the Roman armies to the mismanagement of the aristocratic party, and Marius was now chosen consul in order to avert the danger to the state. The barbarians attacked him in his camp, but Marius drove them back. He then followed them up and defeated them in two great battles in 103 and 101 B.C. It is said that more than 100,000 of the barbarians were killed in the second battle and about 60,000 taken prisoners and carried to Rome to be sold as slaves. For these great services Marius was regarded as the savior of his country.

The Social War. — It has already been shown that the Italian allies of Rome were not admitted to the same rights as Roman citizens. Having fought in Roman wars and won victories for the benefit and for the glory of Rome, the Italians, as was natural, demanded the same rights as the Roman people. The refusal to grant these demands led to the war known as the Italian or Social War (90–88 B.C.). The Italians formed a republic for themselves, but Rome sent her armies to bring them back to their allegiance. The Italians had the juster cause; for they were of the same race, language, and religion as the Romans, and in all essentials were their equals. Rome, however, was successful in this as in most of her contests, but she gained the victory more by policy than by arms; for she promised the rights of full citizenship to all who did not take part in the war. At the end of this war (88 B.C.) all Italy to the south of Cisalpine Gaul, with the exception of the Lucanians and the Samnites, acquired the same rights as Roman citizens.

Sulla and Marius. — Sulla, who had been an officer in the army of Marius, became his rival in political affairs at Rome and was chosen by the nobles or senatorial party as their leader. For many years there was a struggle for mastery between the popular party, whose chief was Marius, and this aristocratic faction, headed by Sulla. After the Social War there arose serious trouble in Pontus in Asia Minor, where Mithrida'tes, the king, had conquered several of the Roman allies and had caused the murder of nearly 70,000 Roman citizens. Marius and Sulla both desired the command of the expedition against Mithridates, but Sulla finally prevailed, and when his opponents tried to set aside his election, marched against Rome and forced Marius to flee into Africa. Sulla was completely successful against Mithridates, and forced the Greek states which had joined forces with the Asiatic ruler back into submission. While Sulla was absent, Marius returned to Italy and took a terrible revenge upon the adherents of his rival. The consul was murdered and the leaders of the

aristocratic party were forced to flee from Rome. Marius died before the return of Sulla, but his party still continued in power.

When Sulla heard of the events at Rome, he made peace with Mithridates (83 B.C.) and returned to the city. His revenge was no less bloody than that of Marius. He caused the body of Marius to be taken from its tomb and thrown into the river Anio. Hundreds of the supporters of Marius were assassinated, and it is said that in Rome alone 3000 people were killed and their property confiscated.

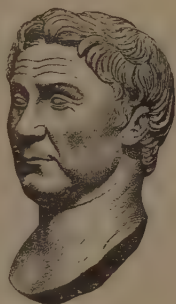

The Career of Sulla. — Sulla was proclaimed dictator of Rome for an unlimited period (81 B.C.). He used his power for the benefit of the aristocratic party, and he ruled as an Oriental despot. But he wearied of the duties of his office and resigned in three years. He died in 78 B.C. The spirit of the man is well shown by the epitaph which he caused to be inscribed on his monument: "I am Sulla the Fortunate, who have surpassed both friends and enemies; the former by the good, the latter by the evil, I have done them."

The War in Spain. — From 77 to 72 B.C. there was a serious revolt in Spain under a brave general named Sertorius. At times it seemed as if the entire peninsula would be lost to Rome, but the command of the Roman army in Spain was in the hands of an energetic general named Pompey, who succeeded in capturing city after city. As he conquered provinces he placed in command of them men on whom he could rely as friends of the Roman state.

Spartacus. — Another revolt nearer home was that of the gladiators. This class of men comprised prisoners of war who were trained to fight combats in public for the pleasure of the Roman mob. One of this degraded class, Spartacus, stirred up his comrades to revolt, and, aided by a large number of discontented men, ravaged the country and threatened Rome. A Roman general named Marcus Crassus defeated them in 71 B.C., and Spartacus was killed. Pompey, however, had the glory of bringing the war to a close. He followed up the remnant of

the gladiators, who were about 5000 strong, and cut them to pieces.

Pompey's Campaigns. — At this time, that is, in the first half of the first century B.C., the history of Rome becomes more and more identified with the lives of prominent Roman citizens. Rome was fast approaching the time when one of her great generals or statesmen would assume the entire control of the city. The old liberties of Rome were dead; patriotism had disappeared; and the attention of the public was directed away from good government at home to conquests abroad. Men who had the ability to win these conquests could secure almost anything they pleased from their countrymen at home. Pompey was one of the men who, having distinguished himself in foreign wars, was looked upon as the natural leader of the city. He increased his already great reputation by his victory over the pirates of the Mediterranean, who had ravaged the coasts of Asia Minor and had become so daring that they attacked the towns on the Italian coast. Worse than this, they intercepted the ships which brought grain to Rome. Pompey secured complete command of the territory infested by the pirates, and within three months he succeeded in breaking up their power. It is said that he put 10,000 of them to death and captured 3000 of their vessels.

POMPEY

Soon after this he was chosen as the general to command in the war against Mithridates. In this campaign he was no less successful. The war lasted from 66 to 64 B.C., ending with the complete overthrow of Mithridates, whom Pompey put to flight and who finally committed suicide. As a result of Pompey's expedition in the East, all western Asia was reduced to subjection. On account of these successes he became the idol of his countrymen. No general had ever enjoyed such a triumph as that which was granted to him on his return to Rome. It is said that hundreds of princes walked as captives in his tri-

umphal procession. It was his boast that he had conquered Africa, Europe, and Asia, thus completing for Rome the conquest of the world.

Party Strife in Rome. — During the years that followed the death of Sulla, Rome was the victim of constant party struggles. On the one side was the aristocratic party, which was conservative in temper; on the other was the popular party. At the

CICERO

head of the army was Pompey, whose friend and representative during his absence in Asia was Marcus Tullius Cicero, the foremost orator in Rome. The leader of the popular party was Julius Caesar, who in a few years was destined to prove himself the greatest of the Romans and one of the most remarkable men of all time. Besides these well-defined parties, there were various discontented elements in the state, which, being com-

posed of disreputable or anarchistic men, were opposed to any stable form of government.

To this latter class belongs Catiline, whose conspiracies at one time threatened to overturn the government. Catiline was a young patrician who had been in the service of Sulla and had distinguished himself by his bravery as well as by his vices. Wishing to secure for himself and his partisans the control of the forces of the city, he planned during Pompey's absence to murder the consul Cicero and burn Rome. This plot, however, was betrayed to Cicero, who denounced Catiline with such vigorous eloquence that he was obliged to flee from Rome. He was accompanied by many of his revolutionary companions, but they were overtaken before they had proceeded far and were slain in 62 B.C.

The First Triumvirate. — Pompey was a weak and vacillating politician, and he owed his fame more to good luck than to any very extraordinary ability. Caesar succeeded in winning him over to his views, and formed with him an alliance against the aristocratic party in Rome as represented by the Senate. What is known as the First Triumvirate was a union between Caesar, Crassus, and Pompey, for the purpose of furthering their own ends. All real power in Rome was in the hands of these three men, and the chief offices of the state were divided among them. Caesar secured the consulship in 59 B.C., and after the expiration of his term of office became the pro-consul of Gaul for five years, this term afterwards being prolonged through his efforts for another five years. Pompey obtained the command of Spain, and Crassus of Syria, but the main interest of history for the next few years centers in the career of Caesar in Gaul.

Caesar's Gallic Campaigns. — From 58 to 50 B.C. Caesar was engaged in subduing the barbarous tribes of Gaul, and he has left us a record of his campaigns in his famous Commentaries on the Gallic War. He saw that there was a chance for him to win great military renown, and he improved every opportunity. At this time Gaul on the Italian side of the Alps was already a Roman province; but among the barbarians to the north, although there were some allies of Rome, little reverence was felt for the Roman name. In two years Caesar succeeded in reducing them to submission.

But there were other enemies of Gauls and Romans alike on the other side of the Rhine. These were the Germans, whose aggression on the Gauls caused the latter to appeal to Caesar for aid. Caesar drove the Germans across the Rhine, but did not effect any permanent conquest on their own land, although he established a barrier against them which endured for several hundred years. From Gaul Caesar made two expeditions against Britain, where he defeated the natives but did not bring them under the control of Rome. On his return to Gaul, he was called upon to put down a serious rebellion of the

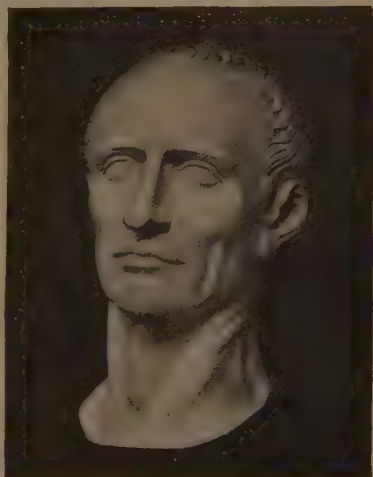

Gallic tribes. In this he was successful. As a result of his campaigns in Gaul, the entire country from the Pyrenees Mountains to the Rhine was subdued and for several centuries remained a Roman province.

Pompey and Crassus. — While Caesar was in Gaul, Pompey and Crassus, the other two members of the Triumvirate, ruled as consuls during the year 55 B.C. Crassus then set out for Syria, but was killed in the course of a campaign in Parthia. Thus Caesar and Pompey remained as the sole leaders of the Roman people. It was natural that a bitter rivalry should arise between them; for Caesar continued the leader of the democratic party, while Pompey returned to the aristocratic party to which he formerly had belonged. The latter remained in Rome, and, while he watched with anxiety the success of his rival in Gaul, did all he could to win the favor of his fellow-citizens. He distributed alms freely and spent large sums of money on the public games. The nobles were naturally on the side of Pompey; for they feared the growing power of Caesar, who was the democratic champion. It was soon evident that Caesar intended to stand for the consulship; for as his command in Gaul would expire in 49 B.C., unless he were in the meantime chosen to an office, he would have to fall back to the rank of a private citizen. The friends of Pompey determined to prevent Caesar's becoming consul, and required that before he ran for the office he should lay down his command of the armies of Gaul. To this Caesar replied that he would take this step if Pompey also would lay down his military command. The Senate refused to consent to this, and demanded that Caesar should resign and disband the army on a certain day.

Crossing the Rubicon. — At this crisis it was a matter of very serious concern what Caesar's decision would be. If he refused to obey the Senate's order, he would be in effect a traitor to the state. On the other hand, if he did obey and disbanded his army, he would merely be a private citizen again, and his enemies would have the complete control of

affairs. Caesar knew, moreover, that all the soldiers in his army were sincerely devoted to him. He knew, too, from long experience of their good discipline and valor, that by their aid he could accomplish almost anything that he chose. Accordingly he did not wait long to make up his mind. With a body of veteran troops he left his headquarters at Ravenna and advanced to the little river Rubicon, which divided his province from Italy proper. If he crossed the stream, it amounted really to a declaration of war. With the full knowledge of this he crossed the river, exclaiming: "The die is cast!"

Civil War.—In a short time Caesar was master of all Italy, for Pompey and his friends fled in hot haste across the Adriatic Sea to Greece. He hoped in the East, which was the scene of his former victories, to be able to gather a large army with which to oppose Caesar. While Pompey was thus engaged, Caesar conquered Sicily, Sardinia, and Spain, and then set out

CAESAR

in pursuit of Pompey. The forces of the two generals met on the plain of Pharsalus in Thessaly, and the result of the battle was the utter defeat of Pompey, who then fled to Egypt, where he was treacherously murdered. This left Caesar the sole ruler of the Roman world,—a ruler in fact but not in name, for he did not assume the title of king. There was still some work for him to do in Africa, where the adherents of Pompey held out, and in Asia Minor, where a revolt had been started against the Roman power.

In Egypt Caesar took up the cause of Cleopatra, the queen, and defeated a younger brother, Ptolemy, with whom she had quarreled. Having seen her securely established on the throne, Caesar turned his attention to the revolt in Asia Minor, which he put down after a brief campaign, recording his success in the famous dispatch: *Veni, vidi, vici* — "I came, I saw, I conquered." The last stand of the adherents of Pompey was made in Africa and in Spain, but Caesar completely overthrew the republican forces at Thapsus in Africa (46 B.C.) and at Munda in Spain (45 B.C.).

Caesar as a Civil Ruler. — These events placed all power in the hands of Caesar. Rome was from this time forth in effect a monarchy; for the republic came to an end when the last hopes of Pompey's allies were destroyed in the battle of Thapsus, and when the stern republican Cato killed himself rather than see the state transformed to a despotism. Yet Caesar preserved all the old forms of the constitution and did not assume the name of king, but remained as a dictator, the office having been granted to him at first for ten years and later made perpetual. He was also allowed to retain the title of Imperator (from which our word *emperor* is derived), which up to this time had been merely a temporary title held by a victorious general until he laid down his command.

Although Caesar possessed this absolute power, he governed with wisdom and justice. He pardoned those who had been in arms against him and broke with the old and narrow policy of the state by granting important privileges to the provincials. Thus he bestowed the citizenship on the inhabitants of Gaul. He did his best to secure an honest administration of the provinces; he adorned Rome with beautiful public buildings, and in the short time between his rise to power and his death, introduced many important reforms and improvements in all departments of the administration. He planned to execute still more extensive ones, but was murdered before he had time to complete them.

The Death of Caesar. — Naturally such extraordinary success

made him enemies, and though the city seemed in the main to be contented with his rule, it was easy for his ill-wishers to play on the passions of the people by pointing out that he had aimed at the complete overthrow of the constitution and the establishment of a tyranny. It was said that he intended to assume the title of king. Several times a crown

THE DEATH OF CAESAR

was publicly offered to him and he refused it; but his refusal was thought to proceed merely from his perception of the displeasure of the people. A plot was formed against him, and the Ides (15th day) of March, 44 B.C., was fixed upon for his assassination. The rumors of the intended murder got abroad and Caesar was warned of the plot, but he took no notice of these warnings. On the appointed day he was surrounded in the Senate by the conspirators and killed. Among the assassins was one whom Caesar had always regarded as his especial friend. This was Brutus, and it is said that Caesar, when he recognized him among his assailants,

ceased to offer resistance, and exclaiming, "Thou too, Brutus!" allowed himself to be slain.

The Greatness of Caesar. — In Shakespeare's play Caesar is styled "the foremost man of all this world," and the title seems to be deserved; for he was great not only as a general, but as a statesman and an author. To summarize his exploits as a general, it may be mentioned that he conquered Gaul, invaded Britain and Germany, conquered Spain, scattered the forces of Pompey, subdued Egypt, routed the King of Pontus, and crushed out the final opposition of Pompey's adherents in the battles of Thapsus and Munda. It is said that he fought fifty pitched battles, in which the lives of over a million men were lost.

His merit as a statesman is twofold. He had, in the first place, the wisdom to see that Rome ought no longer to endure the mob rule from which she was suffering during the period of civil strife, and that the time had come for the establishment of a one-man power in the state. In the second place, when he gained this power, although it was absolute, he did not use it for selfish or unwise ends. He used it for the public good, and though the time of his rule was short, he did work of lasting benefit which won for him fame as a statesman equal to, or even greater, than his fame as a general. His title to literary renown rests upon his two books, the one on the civil war and the other on the Gallic war. The latter is an almost perfect model of concise and graphic historical writing, and remains to this day a familiar classic of literature.

Antonius and Octavius. — The conspirators who struck down Caesar gained nothing by their act. His colleague in the consulship was Mark Antony (Marcus Anto'ninus), who, in an eloquent oration at the funeral of Caesar, aroused the feelings of the multitude against the conspirators to such a pitch of fury that the latter were obliged to leave Rome. Antony, for a time, was the foremost man in the city, but he had a dangerous rival in the young Octavius, whom Caesar had made his heir, bequeathing to him both his name and his property.

Octavius, or, to give him the name to which he was entitled on the death of Caesar, Gaius Julius Caesar Octavianus, was at this time but eighteen years of age. When the news of Caesar's death reached him, he was pursuing his studies at Apollonia, and the veteran troops stationed at that place, were ready to support him loyally as the heir and adopted son of their old general. On Caesar's death Antony appropriated his wealth, and it was thought at first that Octavius would

lead an army against Rome and seek vengeance. Instead of this, however, he came to Rome with only a few followers. Antony's reckless and dishonest conduct had brought him into public disfavor. Octavius and he were soon at odds, but were finally reconciled.

The Second Triumvirate.—As a result of their agreement, the Second Triumvirate was formed, comprising Antony, Octavius, and Lepidus, who possessed all the powers of government. Almost their first act was to draw up a list of 300

senators and 2000 knights of the hostile party to be put to death. The first name on the list of senators was Cicero's, and he perished in the wholesale massacre that followed. One object of forming the Triumvirate was to crush the forces of the murderers of Caesar. Brutus and Cassius, the leaders of the conspirators, had fled to the East, and had there gathered a considerable force. Antony and Octavius went over to Macedonia and met the army of the republicans at Philippi (42 B.C.), and there won a decisive victory. After this defeat Brutus and Cassius killed themselves, and all hope of a restoration of the republic was lost. The Roman world was divided between the triumvirs, Antony governing in the East, Octavius in the West, and Lepidus in Africa. Lepidus was a man of weak character and slight ability, and his share soon passed into the hands of his colleagues.

The Overthrow of Antony. — Antony's government in the East had been unwise and oppressive. He made his headquarters at Alexandria, and there coming under the influence of the famous Egyptian queen, Cleopatra, he seems to have lost all ambition and prudence. Finally, when he had insulted Octavius by divorcing his wife, Octavius' sister, and had angered the people by giving Roman provinces to Cleopatra, the peace between him and Octavius came to an end. Both sides made preparations for war, and the first decisive battle was fought off the promontory of Actium on an inlet of the Ambracian Gulf (31 B.C.). It is said that Cleopatra deserted Antony's side in this battle, and that Antony, seeing her take flight, gave up the fight and followed her. At all events, the battle of Actium was a complete victory for Octavius, to whom both the fleet and the army of Antony at once surrendered. Antony followed Cleopatra to Alexandria, but Octavius pursued them and laid siege to the city. Deserted by his troops and deceived by the rumor that Cleopatra had committed suicide, Antony killed himself. Cleopatra, fearing that she would be brought as a captive to Rome, also committed suicide.

Octavius. — Octavius was now without a rival. The Senate

had sunk to the position of a servile body and all its powers were exercised by a sort of Privy Council, composed of the friends of Octavius. On his return to Rome, he received three triumphs. The Senate was willing to grant him all the powers that he desired. He avoided, however, the kingly title, and even resigned his command in the army, but he was requested to resume it for a period of ten years, and the term was afterwards continued. Though nominally ruling under the old forms, he was really an emperor, and the date 27 B.C., when the title of Augustus was bestowed upon him, may be taken as marking the beginning of the imperial monarchy.

CHAPTER XXIV

THE ROMAN EMPIRE

The Government. — We have seen already that although

AUGUSTUS

Rome was in reality an absolute monarchy, the forms of the republic were continued. The Senate was still kept up and there were consuls chosen every year, but the Senate always voted as Augustus wished and the consuls and other magistrates were obliged to do the emperor's bidding. Augustus united in himself the functions of all the magis-

trates, both civil and ecclesiastical. His officers were his own creatures and for the most part were mere figureheads. He

was careful not to offend the people by assuming the pomp appropriate to his great position, and he contented himself with having the substance rather than the show of power. It was the principle of the Roman state that the emperor was the source of all authority.

The Extent of the Empire. — Augustus is said to have ruled over 100,000,000 people living within the confines of the empire. The geographical limits of this empire were the Atlantic in the west, the Euphrates in the east, the forests of Germany in the north, and the African desert in the south. In other words, it took in all the civilized Western world. Outside of Italy, the empire was divided into provinces, which in the time of Augustus numbered twenty-seven and may be grouped under the heads of Western or European, numbering fourteen, Eastern or Asiatic, numbering eight, and Southern or African, numbering five. It will be noted from this what a great variety of races must have been comprised within the dominion of the emperor. There were in reality three distinct civilizations; viz. the Latin, which included the western part of the empire; the Greek, including both Greece proper and the Greek cities of Asia Minor; and the Oriental civilization, including the countries as far east as the Euphrates. It was the aim of Augustus to unite these discordant civilizations into an harmonious whole, and for this purpose he traveled throughout his wide domains granting privileges here and there, founding colonies, and trying to make all classes of his subjects turn to him as the source of all power and beneficence.

The Reign of Augustus. — Augustus ruled for about forty-two years, that is, from 27 B.C. to 14 A.D., and this period is known in history as the Golden Age of Latin Literature. To it belongs the great historian Liv'y; the poet Vergil, the author of the *Aeneid*; Horace, the writer of many odes, satires, and other poems; Lucre'tius, the philosophical poet; Catul'lus, the lyrical poet; Sallust, the author of the history of the Jugurthine War and of Catiline's conspiracy. Besides these, there are many

writers who, although they did not flourish until after the death of Augustus, were so near his reign in point of time that they seem to belong to the Golden Age. Among these are the poet Ov'id; Martial, the writer of epigrams; Plin'y, the author of a natural history; Ju'venal, the satirist; and Tac'itus, the historian. Augustus and his famous minister. Maece'nas, were generous patrons of literature, art, and architecture.

A ROMAN SCHOOL

In regard to external affairs, the policy of Augustus was one of peace. He endeavored to persuade the Roman people that it was foolish to attempt to push their conquests further. The temple of Janus, which, according to the ancient Roman custom, was opened in time of war and closed in time of peace, was opened only three times during the reign of Augustus. There was one war, however, which was of importance as bringing the Romans into conflict with the people that were destined ultimately to overthrow the empire. This was the war in Germany, where Varus, who had tried to force the Teutonic tribes to submission, was attacked by them under their chief Armin'ius or Hermann. The whole army of Varus was destroyed and he himself was killed (9 A.D.). This was one of the worst disasters that had ever befallen a Roman army, and it

is said that Augustus never ceased to grieve over the defeat, exclaiming in his sorrow: "O Varus, give me back my legions!" The importance of this event can be better understood in tracing the whole history of Rome's relations with the barbarians. It is sufficient now to state merely that this reverse changed the policy of Rome; henceforth she contented herself with a policy of self-defense, maintaining the line of the frontier, but not as a rule seeking to extend her power beyond it to the north.

The Augustan Line of Emperors, 14-68 A.D. — One of the weaknesses of the Roman state was the lack of a definite law of succession. The principle was not firmly established that the emperor's son should succeed him, and much of the history of the empire is taken up with the wars resulting from disputed claims to the throne. It will not be possible within the limits of this book to mention, or to give in detail, the reigns of the long line of Roman emperors after Augustus. The principal emperors, or those in whose reigns some especially striking events have taken place, will alone be described. All the Roman emperors after Augustus were called by his name, but the title Augustus was merely a sign of the office and there were only four emperors who actually belonged to his family. These emperors of the Augustan line were, in the order of their reigns, Tiberius, Calig'ula, Claudius, and Nero. Their reigns lasted until 68 A.D. These four emperors were among the worst in the history of the Roman Empire.

The reign of Tiberius is marked by an important change affecting the Praetorian Guard, a body of 10,000 picked troops. They were gathered in a fortified camp near one of the gates of the city. Formerly they had been scattered throughout the city. This concentration of the guard had a great influence upon subsequent history. They soon came really to rule Rome, for emperors were set up or deposed according to their wishes.

The reign is also marked by an extreme usurpation of authority on the part of the emperor. His word was law, and

he could punish with the penalty of death any one of his subjects without trial. A cruel and licentious ruler, he tired of governing after a while and devoted the latter part of his life to the gratification of his vices, surrendering the power at Rome to one of his friends named Seja'nus. The latter plotted against his master, who became so suspicious on the discovery of the conspiracy that hundreds of men and women who had taken no part in it were put to death. Finally he was killed by one of his servants.

Caligula was even worse. His savage cruelty was such that there seems to be nothing to account for it but a supposition of madness. He, too, after a reign of monstrous vice and brutal cruelty, was murdered by his own guards.

His successor, Claudius, was less vicious than Caligula, but was weak in character, and wholly under the influence of his wife Agrippina, an unprincipled and ambitious woman, who finally murdered her husband in order that her own son by a previous marriage might come to the throne. In this design she was successful, and Nero became emperor.

Nero inherited all the vices of his mother, and added to them many of his own. One of the greatest authors of his time, Sen'eca, was put to death as the result of the emperor's jealousy. Nero was one of the persecutors of the Christians. Down to his reign they were looked upon merely as a Jewish sect and were unmolested; but now that they were discovered or recognized as a separate body, they were hunted out, brought before the magistrates, and condemned to death in large numbers. Their execution was accompanied with tortures. Some were killed by wild beasts, others nailed to crosses or burnt alive. In Nero's reign occurred the great fire. He was long supposed to have caused it himself, and, according to one story, he amused himself by playing on a flute while Rome was burning. Finally his legions broke out in revolt, and fearing that he was going to fall into their hands, he caused himself to be killed by one of his slaves in 68 A.D. After a contest between rival chiefs during several months, the empire was finally

quieted by a member of the Flavian house by the name of Vespa'sian.

The Flavian Emperors. — The first of the Flavian emperors was Vespasian, who reigned from 69 to 79 A.D. He was one of the good emperors. He restored order to the state, reformed the finances, and improved the city. His son Titus captured Jerusalem in the year 70 A.D., and it is said that over a million Jews lost their lives at this time. The temple of Jerusalem was destroyed, and the inhabitants of the city who survived the attack were sold as slaves. It was also in the reign of Vespasian that Britain was subdued by an able Roman general, Agric'ola,

ARCH OF TITUS (ROME)

who made the island a Roman province, and was its governor 78-85 A.D.

Vespasian was succeeded by his son Titus, who reigned only two years, from 79 to 81 A.D., but in this short time he won the regard of the people by his many kindly acts. Three great disasters befell Rome during this reign. The first was a terrible fire which was almost as disastrous as the great fire of Nero's reign. The second was the visitation of the plague, which destroyed the lives of many Romans; and the third was the eruption of Vesuvius, which buried the cities of Herculaneum and Pompeii (*Pompa'yee*). The ruins of these cities

EXCAVATING A HOUSE AT POMPEII

were not brought to light until the early part of the eighteenth century. Excavations made then and since have shown the cities exactly as they were at the time of the disaster, thus enabling us to see what a Roman city was 1900 years ago.

Titus was succeeded by his younger brother, Domitian, who reigned from 81 to 96 A.D. He was of a cruel and jealous temper, and his reign is stained by many acts of tyranny and

by revolting crimes. The so-called "second persecution of the Christians" took place in his time, for this class of worshipers were especially hated by Domitian. At last he was murdered in his palace by one of his freedmen, 96 A.D.

Nerva, Trajan, and Hadrian (96-138 A.D.). — After the murder of Domitian the Senate elected one of their own members to the throne. This was Nerva, whose short reign was marked by mildness and a wise administration of the government.

More important in history was the reign of Trajan, who was a native of Spain and one of the best of the Roman emperors. Trajan pushed the boundaries of the empire farther to the east and to the north than they had ever been carried before, and his renown as a soldier was equaled by his taste in literature; for he was the patron of some of the greatest of the Roman writers, — Juvenal, Plutarch, and Pliny the Younger. He was also the great patron of architecture, adorning the city of Rome and the other cities of the empire with temples, theaters, and other structures. He died in 117 A.D., after a reign of nineteen years.

The successor of Trajan was Hadrian, who reigned from 117 to 138 A.D., and he, too, was a patron of arts and learning. He founded many fine buildings in different parts of the empire. He passed most of his time in traveling throughout the provinces of the empire, but spent the latter part of his reign at Rome, where he built one of the finest of the Roman temples, — the temple of Rome and Venus.

The Two Antonines (138-180 A.D.). — From 138 to 161 A.D., the imperial throne was occupied by Antoninus, surnamed Pius, whose reign was peaceful and prosperous, but is not remarkable for any very striking events.

His adopted son, Marcus Aurelius, who came to the throne in 161 A.D., is more famous in history. He was a philosopher and an author, but although he would have chosen a life of retirement given over to study, he showed himself energetic in dealing with the barbarians, guarded the eastern frontier, and

drove back the invading troops of the Germans across the Danube.

The Rule of the Army. — For a period of nearly 100 years the emperors were set up and pulled down at the will of the soldiery, and in consequence their reigns were very short. It will not be necessary to go into the details of each reign, but the accompanying table¹ will show the names and dates of these emperors. During this time the Germans were pressing upon the frontier of the empire and in the short reign of Decius, 250 A.D., the Goths defeated the Roman army, and killed the emperor. Not long after this they seized the province of Dacia, and began sending plundering expeditions through the eastern domain of Rome.

Diocletian (284-305 A.D.). — Under the energetic rule of Diocle'tian and his successors, the empire was strengthened and the government became an absolute monarchy. All pretense of ruling under republican forms was thrown aside, and the personal authority of the emperor was supreme in name as well as in fact. Diocletian, thinking it too difficult for one man to govern his vast domains, chose a colleague, Maxim'ian, who ruled in the West while he himself ruled in the East. Besides these two emperors, who each bore the title of *Augustus*, there were two subordinate officers called Caesars, to each of whom was assigned a portion of the empire. Thus a precedent was established for the division of the Roman state. Another feature of this reign was the fierce persecution of the Christians. Diocletian did his best to destroy the new

religion. Christian churches were pulled down; the worshipers were hunted like wild beasts, and when taken were put to death with tortures.

Constantine the Great (306-337 A.D.) and his Successors. — Constantine was the son of Constan'tius Chlorus who had ruled over Gaul, Spain, and Britain under Diocletian, and on the latter's death had been raised to the rank of Augustus. In the following year Constantius died in Britain, and Constantine was pro-

claimed emperor by the troops. But there were several rival claimants, and it was only by hard fighting that he gained the imperial power. There is a legend that just before meeting one of these rivals (Maxentius) on the field of battle, Constantine saw a sign of the cross in the sky with the words "By this conquer," and that, being victorious in the fight that followed, he gave up his pagan gods and became a Christian. It is certain that he showed a friendly spirit toward the new faith early in his reign, and in 313 A.D., by the Edict of Mil'an, he granted it toleration.

At first he ruled as joint emperor with Licinius, but by the year 324 A.D. he made himself sole ruler. He transferred the capital from Rome to Byzan'tium on the Bosphorus, the latter city being thenceforth called, in his honor, Constantinople. This change was of great importance; for it prepared the way for the separation of the empire into the Eastern and Western divisions, the former with its capital at Constantinople and the latter with its capital at Rome. In Constantine's time, however, the new city was the seat of government of the whole Roman world.

The chief event of Constantine's reign was the making of Christianity the state religion. The Christian church had already become a very powerful body and the friendship of Constantine added greatly to its strength. Although a later emperor, Julian the Apostate, who came to the throne in 361 A.D., tried to restore the old pagan gods, he failed completely, and before the close of the century Christianity was the dominant religion of the Roman state. In the reigns of Constantine's successors the main interest attaches to the relations of the empire with the Germanic tribes who were trying to force their way across its frontiers.

SYNOPSIS FOR REVIEW

CHAPTER XXV

THE TEUTONIC MIGRATIONS

ROME AND HER GERMAN FOES

The Roman Frontier. — The frontier of the Roman Empire on the continent of Europe was marked almost exactly by the courses of the Rhine and the Danube rivers. To the north of this irregular line lived a number of barbarous tribes all belonging to that division of the Aryan race which is called Germanic or Teutonic, but having no common government, and, if we may judge from their constant wars among themselves, quite unaware of their kinship.

The Germans ; their Origin. — It has already been said that at a very remote period the forefathers of all the Aryan races lived together, and that the home of the original stock was probably in western Asia. Of those divisions which remained in Asia, that is, the Persians, Medes, and Hindus, some account has been given. The other divisions, five in number, migrated to Europe more than 2000 years B.C. These were the Greeks, Italians, Celts, Slavs, and Germans, of whom the first two were fortunate in securing the spots most favored by nature and best adapted to the development of civilization. Consequently the Greeks and Romans were the first of the European Aryans to emerge from barbarism and build up great states. Their story also has been told.

Of the three remaining races the Germans have the most interest for us, for it was they who founded the great European states of to-day. Beginning their migration at about the same time as the other Aryan tribes, they spread over the vast tract of country between the Black and Caspian Seas on the east and the North Sea on the west. To the north of them were the Slavs, who do not become of historical importance till many centuries later, and to the south were the Celts, who at the time of which we are treating

lived within the limits of the Roman Empire and may for our purposes be regarded as Romans.

Early German Civilization. — These German ancestors of ours, for so we must consider them, since the chief element of the English-speaking race is German, continued in the barbarous stage while the Romans advanced to the founding of a great empire and were already on the road to decline; and from the first century B.C. to the fourth century A.D. there was little change in their condition. To judge from the accounts of Roman writers during this period, they had hardly passed the

EARLY GERMANS

degree of civilization reached by our North American Indians of to-day. They lived in huts, kept herds of cattle, and tilled the ground, but at short intervals the whole tribe would move away either in search of new lands or in the hope of conquering and plundering their neighbors. They knew no higher organization than that of the tribe, and they valued no authority but that of the chief whom they themselves had chosen. Even

he held his office by their consent and had but little power in time of peace; for their main object in electing him was that they might have a leader in war, and if he attempted to enforce the same obedience to his commands when war had ceased, he was promptly deposed or murdered. In other words, the real power was in the people themselves; for they were, above all, liberty-loving and unruly.

Physical and Moral Characteristics. — Physically the Germans were a fine race. Tall, well-formed, with muscles hardened by constant exercise, they seemed like giants to the smaller, weaker Romans, who, in spite of superior discipline, were often no match for them in battle. Roman writers give striking accounts of their fierce blue eyes and blond hair, their enormous size, their feats of strength and daring, and the absolute fearlessness with which they would rush to certain death on the battlefield.

Another matter of surprise to the Romans was the high standard of morality which they found among these savages. The German was content with one wife. The women were pure and treated with respect. Any violation of chastity met with the severest punishment, and as a rule the marriage vow was respected. Yet the Germans had the vices of barbarians. They drank to excess and were possessed by the passion of gambling, sometimes even staking their liberty on the chance of the game, the loser becoming the slave of the winner.

Such is the account which the Roman writers have given us of the Germans. In some points it may be exaggerated; for, as the Romans were worsted in their encounters with their warlike neighbors, pride might naturally lead them to magnify the strength of these victorious enemies. Then, too, the hope of improving the corrupt morals of the Romans might induce the historian to paint in too glowing colors the virtues of barbarians, that his countrymen might be put to shame by the contrast. Yet it is safe to conclude that these primitive Germans were a brave and sturdy race, and in many respects were superior to ordinary barbarians.

Roman Attempts at Conquest. — At first the Romans hoped to conquer the Germans and make them as good subjects of the empire as they had made the Gauls, but they found that they had undertaken a very difficult task. In the middle of the first century B.C. Caesar crossed the Rhine into Germany to punish the insolence of the German chief Ariovistus, who had made war upon the Gallic allies of Rome; but neither at this time nor on the occasion of a second invasion did the greatest of Rome's generals succeed in gaining permanent control over any portion of the German territory. In the reign of Augustus the Romans fared still worse. Varus, at the head of three Roman legions, crossed the Rhine and joined battle with the Germans in the Teutoburg Forest (9 A.D.). He was killed, and his army was almost wholly destroyed. Thenceforth Rome was content in the main with a policy of self-defense, and bent all her energies to keeping the Rhine frontier unbroken.

The Period of Successful Defense. — For about 150 years after the defeat of Varus, the Roman Empire managed to hold its own and the troublesome neighbors on the north were unable to break through the line of the frontier; but in 168 A.D. a confederation of German tribes, including the Marcomanni and others, being pushed on by the tribes behind them, crossed the border from what is now Bohemia and took possession of some Roman lands. After a long period of warfare, the imperial government granted them certain lands along the Danube, and there the most of them remained, a constant source of trouble to the empire on account of their quarrels and lawlessness. Later a part of the Alemanni, another confederation of German tribes, seized some lands along the Danube and upper Rhine. After a time these tribes felt the effect of the Roman civilization.

For nearly a century, that is, till the reign of the emperor Decius (249–251 A.D.), the empire was not seriously threatened, but Decius came into conflict with a new foe. The Goths, one of the largest divisions of German tribes, invaded the province called Mœsia, and started on their usual course of

plundering and killing. Decius met them in battle, but was defeated and slain, and a few years later the emperor Aurelian gave them the Roman province of Dacia as the price of peace.

Another century of comparative security followed. At its close, the Goths again were the disturbers. The eastern division, who were called Ostrogoths, had as neighbors in the region about the Black and Caspian Seas a peculiar and warlike race, called Huns, who were constantly pressing westward and making war on all who stood in their way. These Huns attacked the Ostrogoths, defeated them, and forced them into their service as allies. Then the combined force of Huns and Ostrogoths fell upon the western division of the Goths, known as Visigoths, and crowded them southward to the Danube. In these straits the Visigoths begged the emperor to let them occupy the lands just to the south of the Danube, agreeing to defend them against attack. This was granted, and in 376 they crossed the river and settled in Moesia.

The Battle of Adrianople (378 A.D.). — These newcomers, the Visigoths, were hard people to deal with at best, but the Romans seem to have given them a just cause of offense. The officials of the empire misgoverned them and robbed them until finally the barbarians broke out in revolt. The Roman emperor Valens thereupon set out with an army to punish them, and the forces met in battle at Adriano'ple, 378 A.D. The Roman army was beaten, and Valens himself was killed in the retreat. This battle was very important; for it taught the Germans that they were more than a match for the Roman legions, and it opened the way for the invaders. Great throngs of barbarians crossed the frontier, the Visigoths pressed on and took what lands they chose, and it looked for the moment as if the empire was at an end; but the skill and bravery of one able ruler checked for a time the progress of the enemy and prolonged the life of the Roman state. This ruler was the emperor Theodo'sius.

But before going on to the events of his reign, it will be well

to learn something about the names and position of the various German tribes with whom he and his successors had to deal.

The German Tribes in the Fourth Century A.D. — Starting from the east, in the region to the north of Greece and between the Adriatic and Black seas, we first find these Goths of whom we have spoken. They were of pure German blood, and it is in their dialect that the Moeso-Gothic version of the Bible was written, the oldest book in a Germanic language that has come down to us. Both divisions of them — the Western or Visigoths, and the Eastern or Ostrogoths — were occupying portions of the Roman territory in the latter part of the fourth century, but the Visigoths had penetrated further into the empire than their kinsmen.

North and east of the Goths lived two races, the Slavs and the Huns, who were not of German blood. The Slavs, who occupied the southern part of what is now Russia, did, indeed, belong to the same grand division as the Germans; that is, they were Aryans; but the Huns, who lived near the Black Sea, were of an entirely different race, the Turanian, and closely allied to the Turks or Tartars. To the west the nearest German neighbors to the Goths at this period were the descendants of those German tribes, the Marcomanni and others, who had settled in the lands near the Danube in the second century.

Still further west along the upper Rhine lived the Alemanni, who at one time had threatened Italy itself, and beyond them to the west dwelt the Franks, who were destined to become the most powerful of all the Teutonic tribes. The Franks held the lands along the lower Rhine near its mouth, and a part of what is now northern France. To the north and east of them, between the mouth of the Rhine and the mouth of the Elbe, were the Saxons, our nearest relatives among all these peoples; for at a later time, with two neighboring tribes, the Angles and Jutes, they conquered and settled in Britain. Finally, two more tribes,

the Burgundians and Vandals, are found along the southern shore of the Baltic Sea.

Such was the situation of the German tribes in the fourth century. Already one of these tribes, the Goths, had begun that great movement which was to destroy the Roman Empire and change entirely the face of western Europe.

Theodosius saves the Empire. — After the defeat of Valens at Adrianople in 378, it seemed as if nothing could stop the rush of the barbarians into the very center of the empire. Not only had the imperial crown descended to feeble rulers unworthy to wear it, but the empire had fallen apart and the power was divided between an emperor at Constantinople and another at Rome. The Eastern emperor, however, had the wisdom to call in the aid of the only man who could save the state from destruction. He sent for Theodosius from Spain, and gave him command of the army. Theodosius did not try to drive out the Goths, but he set them to quarreling among themselves and weakened their power. He gave them lands, but he made them keep within limits that he defined. To the Visigoths he gave Thrace and to the Ostrogoths Pannonia. In his reign something like the old power of the empire was restored and his rule extended over both East and West; but on his death in 395 the empire was divided between his two sons, Honorius ruling in the West and Arcadius in the East. They were as weak and foolish as any of their predecessors, and their folly helped on the fall of Rome almost as much as the attacks of the barbarians.

The Visigoths. — Already it had become the practice to recruit the Roman army from German subjects, so that the empire was relying for defense on the kinsmen of the very men who were attacking it. Almost immediately after the death of Theodosius, the Visigoths began to give trouble. They chose for their chief Al'aric, an able and valiant leader, who determined to gain for his people new and better lands, and with this end in view marched them directly into the heart of Greece. The Romans still had one able general.

Stil'icho, a Vandal in the service of the Western Empire, led an army into Greece and forced Alaric to withdraw into Illyria; but this province was so near Italy that the temptation to the Goths to pass around the head of the Adriatic and march on Rome proved too strong. They did so; but there they again found Stilicho in front of them. This time the two armies met in a fierce battle at Pollentia (403), and the Goths were defeated and driven out. If Stilicho had been permitted to follow up his advantage, there might still have been some hope for the empire; but at this juncture the emperor Honorius, having taken it into his head that Stilicho was plotting to overthrow him, caused him to be murdered, thus depriving Italy of the only man able to hold an army together in the face of her foes.

The Breaking up of the Empire. — In the meanwhile, since it required all the available troops to meet these Visigoths, the western provinces of the empire were left without defenders and a large body of Franks broke into northern Gaul. The Vandals and Burgundians also, leaving their homes on the Baltic, began their southward journey; and the Suevi, another German tribe, entered the Roman dominions. Thus early in the fifth century we find six barbarous German tribes within the limits of the empire: Ostrogoths, Visigoths, Vandals, Burgundians, Franks, and Suevi.

The Sack of Rome by the Visigoths (410). — Promptly on the death of Stilicho, Alaric and his followers returned to Italy. Finding no one to bar their way, they were soon at the very gates of Rome, bargaining with the inhabitants in regard to the terms on which the city should be spared. Receiving a promise that he should have a certain amount of treasure, Alaric consented to leave the city unharmed, and passed on; but the emperor, who at this time was shut up safely in Ravenna many miles away, refused to accept the terms. Alaric then came back and having again failed to bring the emperor to reason, besieged Rome and was soon inside its walls. Fortunately for the Romans, the barbarians were Christians, though

not of the orthodox faith, and what they wanted was plunder which they could take away with them. The churches and the buildings generally were spared, nor is it likely that a large number of the people were killed, but the fact still remained that for the first time in 800 years Rome had fallen into the hands of an enemy. It had been believed that the city could never be conquered, and the easy victory of Alario was a source of mingled surprise and terror to the superstitious, who thought that the end of all things was at hand.

In the Fifth Century there are Six Barbarous Tribes within the Empire: Ostrogoths, Visigoths, Vandals, Burgundians, Franks, and Suevi.—The Sack of Rome by the Visigoths, 410: Alaric captures Rome. The Effect on the Popular Mind.

CHAPTER XXVI

THE FALL OF ROME

The Founding of the Visigothic Kingdom in Spain (415). — Alaric lived but a short time after the sack of Rome. While planning new and extensive conquests, he died in southern Italy and, according to the story, was buried in the bed of the river Busentius, which was turned from its course. That the place might never be known, the slaves who had buried him were killed. His followers became nominally the servants of the emperor Honorius, but in reality did about as they pleased. They went first into Gaul to drive out some rivals of the emperor, and then into Spain, where some rivals of their own, the Vandals and the Suevi, had already settled. They soon cleared a place for themselves in that country, and about the year 415 founded the Visigothic kingdom of Spain, which at first extended as far north as the river Loire in France. This was the first kingdom founded by the Teutonic invaders in southern Europe, and it may be regarded as the beginning of the modern kingdom of Spain.

The Vandals. — Now that we have traced the movement of the Visigoths till their final settlement in Spain, it remains to describe the way in which the other tribes each founded a barbarian kingdom on the territory of the weakened and dismembered Roman Empire.

The next to appear after the Visigothic kingdom was that founded by the Vandals. This people moved down from the shores of the Baltic and were occupying Spain at the time the Visigoths entered it, but were crowded by the latter into that portion of the Spanish peninsula which still preserves the recollection of them in the name Andalusia (formerly Van-

sociated with the idea of plundering that the term 'vandalism' has passed into common use to indicate useless, senseless destruction. They were the early pirates of the Mediterranean, steering their vessels to any coast that promised to yield a booty. They planted colonies in Sicily, Corsica, and the Balearic Isles, but neither there nor in Africa did they leave any permanent traces of their rule; for when their kingdom fell they disappeared completely from the pages of history, and all that we have to remind us that they ever lived in Africa is the presence of an occasional light-complexioned type among the dark-skinned natives of the North African coast.

The Burgundians. — Between 413 and 443 the Burgundians, who had been the neighbors of the Vandals on the Baltic coast, moved down as far as the city of Worms, and a few years later we hear of them in the valley of the Rhone. They established a kingdom in southeastern France and western Switzerland. The term 'Burgundy,' applied to a portion of the region they occupied, preserves their name in history; but they ceased to exist as an independent nation at the same time that the Vandal kingdom was overthrown, in the year 534. Their very powerful and warlike neighbors, the Franks, subdued them in that year, and thenceforth they formed a part of the Frankish kingdom.

Invasion of Britain by the Angles, Saxons, and Jutes. — In the year 449, almost at the same time that the Burgundians founded their kingdom, other German tribes made their appearance in Britain. The island of Great Britain was at that time a Roman province inhabited by a Celtic race called Britons. That portion of the race which lived in England had become thoroughly Romanized and had reached a high degree of civilization; but the northern part of the island was occupied by savage tribes called Picts and Scots, who made frequent inroads into the lands of their civilized neighbors. So long as the latter had Roman legions to protect them, they were secure; but when the empire began to fall to pieces, these legions were needed nearer Rome. Accordingly the Roman soldiers were

withdrawn, and the Britons, left to fight their own battles, could not defend themselves against the Picts and Scots. Going from bad to worse, they finally called in the aid of the German tribes that lived in the region north of the mouth of the Rhine.

Two Jutish chieftains, Hengist and Horsa, were the first to come over. But the Britons found that in saving themselves from one foe they had simply fallen into the hands of another; for their allies, after driving out the Picts and Scots, determined to keep the country for themselves. The first band invited others to join them, and the eastern and southern coasts of England were peopled by hungry hordes of Jutes, Angles, and Saxons who every year drove the natives further to the north and west, until by the end of a century and a half from the time of their landing they were in possession of the best part of the island. So it happened that the language and customs of Englishmen and Americans to-day are German and not Celtic-Roman in their origin; for the war between the two races was one of extermination, and the victory of the German was so complete that the native race left but few traces of itself in England. The very name of the country was changed from Britannia (Britain) to Engla-land (England), the land of the Angles.

The Huns. — Thus by the middle of the fifth century four Teutonic kingdoms were founded on territory that once belonged to Rome: the Visigothic kingdom in Spain, the Burgundian in eastern France and western Switzerland, the Vandal in Africa, and the Anglo-Saxon in Great Britain. There still remain two tribes, the Franks and the Ostrogoths, who before the close of the same century were to found kingdoms on Roman soil; but before passing on to them, it is necessary to speak of some events which mark the closing days of the Roman Empire in the West.

As if Rome had not enough to do in holding out against her numerous German foes, she was called upon to face a new enemy far more savage and merciless than any of the Teutonic

tribes. This was the people known as Huns, whom we have noticed before as causing that westward movement of the Goths which resulted in breaking down the barriers of Rome's provinces in southeastern Europe. They were a terrible race, these Huns, hideous in appearance, with flattened noses, short, thick, misshapen bodies, and yellow skins, and the fear which their repulsive looks aroused in their enemies was justified by the fierceness and bravery they showed in battle and by the cruelty with which they treated all who fell into their power.

Attila. — About the year 433. this people, who were then living in what is now Austria-Hungary, chose for their chief the famous At'tila, a bloodthirsty savage of remarkable military skill and vast ambition. Almost at the same time that the Anglo-Saxon tribes were setting out for Britain, Attila, gathering a large army made up of Huns and German troops whom he had forced into his service, started westward with the object of driving the Romans out of Gaul. City after city fell into his hands, and the country through which he passed was so completely desolated as to give rise to the saying that the grass never grew where the horses of Attila had trod.

But the Romans had an able defender in their general Aë'tius, who succeeded in drawing to his side a large body of Franks from the north and Visigoths from the south of Gaul, and when Attila laid siege to Orleans, the allied Romans and Germans drove him from its walls. Attila then retreated to Chalons'. where he turned and joined battle with his pursuers (451). According to the old historians, the numbers in each of the two opposing armies were enormous, and the battle was the most terrible that had ever occurred. Over 160,000 are said to have been slain. Night came before either side could claim the victory; but on the following day, while the Romans were ready to fight, Attila dared not renew the battle and retreated.

The battle of Chalons is regarded as one of the most important in history; for it was a struggle for mastery between two widely different branches of the human race, the Aryan and the Turanian, and the prize to the victor was the whole of

western Europe. It decided that Europe should remain in the hands of the Aryans, and should advance to a higher degree of civilization than it would have ever attained if it had fallen to the lot of a race akin to the Chinese and the Turks.

Attila in Italy. — Yet it is probable that the Huns could not have long retained their power even if they had won this battle; for, like the Vandals, they were mere destroyers, and showed no ability to build up anything that could last. After the defeat at Chalons their story is soon told. Attila led them into Italy, where the road lay open to Rome, and it seemed for a moment as if the city must fall into his hands; but the prayers of Leo, Bishop of Rome, induced Attila to abandon his plan. It was a strange thing that Leo's appeals should have moved this cruel barbarian to give up so splendid and so easy a prize, and some of the early writers account for it by a miracle, saying that while Leo was talking to him the heavens opened and St. Peter and St. Paul appeared before the frightened Hun. Whatever was his motive, he left Italy almost immediately. Soon after this he died and his people, when deprived of the leadership of this 'Scourge of God,' as he was called, scattered and from this time forth were of no importance in the history of Europe.

Sack of Rome by the Vandals (455 A.D.). — It is to be noted that what life there was in the declining empire was wholly due to the Christian Church. The story of Leo and Attila is a good illustration of the awe which the Church inspired in the barbarians. And we must remember that Attila was not only a barbarian, but a pagan, while most of the German tribes who had entered the empire were already Christianized, though they did not hold the orthodox belief. Yet four years after Attila's invasion, when Rome was again besieged, this time by a Christian foe, and when this same Leo again begged the conqueror to spare the city, his prayer was refused. In 455 Gaiseric or Gen'seric, king of the Vandals, sailed with a troop of plunderers across the Mediterranean from Africa, and, having neither pity, fear, nor reverence, made Rome again the scene of

pillage and murder. These pirates went back to Africa with a rich supply of booty and with many Roman captives whom they sold as slaves.

Fall of the Roman Empire in the West. — For twenty years longer the western division of the empire continued to exist in name, but in reality the whole power was in the hands of the barbarians. The German mercenaries who composed the Roman army decided who should be emperor, and if he governed in a way that was not to their liking, they pulled him down and set up another. Naturally the reigns of these emperors were very short. At last, in 475, the barbarians chose a mere boy who, under the high-sounding name of Rom'ulus Augus'tulus, enjoyed the title but not one vestige of the real power of a Roman emperor. The real ruler in Italy was a barbarian named Odoacer, king of the Herulian Goths. For a time Odoacer put up with this state of things, but finally he grew tired of the pretense and demanded that the young Augustulus should be deposed and the title of Roman Emperor of the West abolished. Further than this, he himself asked to be recognized as ruler in the West under the title of Patrician. The Eastern emperor at Constantinople granted these requests, for he could not help himself. Odoacer became Patrician, nominally ruling in Italy as the agent of the emperor at Constantinople, but really doing about as he chose, with little regard for authority anywhere. Augustulus was deposed and is heard of no more in history.

So came to an end the Roman Empire in the West in the year 476 A.D. It made very little difference to the people at the time, for they were governed in much the same way as they had been before; but the date is one of great importance, for it makes a break in the old traditional order of things and Rome is no longer even in name the capital of the Western world. It is the date at which we may place the beginning of the Middle Ages. The Eastern Empire lasted nearly 1000 years longer, that is, to the capture of Constantinople in 1453.

CHAPTER XXVII

ROMAN LIFE AND MANNERS

Roman Buildings. — In early times the private houses of the Romans were very simple, showing little attempt at adornment

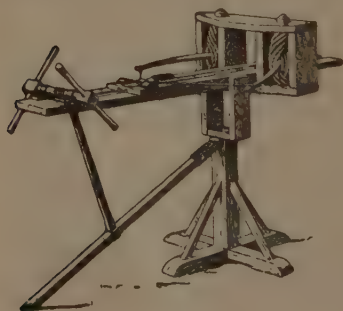

A ROMAN HOUSE

or luxury, but in the later days of the republic and under the empire, the dwellings of the wealthy were costly and beautiful.

The excavations at Pompeii have brought to light many good specimens of Roman domestic architecture as it existed toward the close of the first century A.D. In the center of the ground floor was the *atrium*, the main hall or reception room, from which doors opened into the principal apartments. The *Lares*, or household gods, and the family fireplace were placed in the atrium. The floor was often a mosaic of many-colored stone, and the bare walls brightly painted or covered with frescoes. Fine and costly furniture, including articles of gold, silver, ivory, and bronze, filled the rooms, and the carving showed beauty in design and skill in execution. The Roman town was usually built around a height on which stood the citadel or place of refuge, as well as the various temples of the gods. Near by was the *forum*, or market place, an open space surrounded by public buildings, the center of the business and political life of the town.

Military System. — The Roman army was divided into legions, each of which contained about 6000 men, although at first the number was much smaller. Each legion was in turn subdivided into ten cohorts. Besides the legionary soldiers, the army comprised bodies of auxiliary troops from the provinces or

the allies of Rome. The common weapons were the *pilum*, or javelin, and a short sword, but slings and bows were also used. Cavalry and artillery were employed, but made up a comparatively small portion of the fighting force. The military engines corresponding to the modern artillery included the catapult for throwing darts, the

CATAPULT

ballista for discharging heavier missiles, and the battering ram for breaking in the walls of a besieged town. Another important contrivance was the besieging tower, a wooden

structure with several floors or stories from which the soldiers hurled darts at the besieged, or passed to the top of the walls by means of a drawbridge.

One of the most striking military customs of the Romans was the triumph or reward of honor to a victorious general. It was the highest honor which could be given to a soldier, and was decreed by vote of the Senate. It consisted of a splendid procession through the Triumphal Gate and along the Via Sacra (sacred street) to the Capitol. It was headed by the Senate and the magistrates, after whom came a long line of wagons containing the spoils of conquest, followed by the principal captives. The victorious general, wearing a laurel wreath, was carried in a four-horse chariot at the head of the army.

Religious Worship. —

From the Greeks the Romans borrowed many of their religious notions, and there is a marked likeness between the Greek and Roman forms of worship. The chief Roman gods were Jupiter, — the father of heaven, and his wife Juno; Minerva, the goddess of wisdom; Diana, the goddess of the chase; Mars, the god of war; Vesta, the goddess of the hearth and of the national safety; Ceres, the goddess of agriculture; Mercury, the god

DIANA

of trade; Neptune, the god of the sea; and Venus, the goddess of beauty and love. Besides these was a host of minor deities,

for the Romans saw a divine agent in every natural force. Spirits presided over marriage and birth; every person was under the special care of a *genius*; and there were gods of the forest, of the boundary, of planting, and of sowing.

Religious Officers. — The chief religious officers in the state were the pontiffs, the chief of whom was the *Pontifex Maximus*. They regulated religious worship and saw that all observances were properly maintained. Another important class of priests was the *Augurs*, whose duty it was to ascertain the will of the gods by means of certain signs, such as the flight of birds, the appearance of the sky, the approach of a storm, etc. This was known as taking the auspices, and was a matter of great importance, for the Romans would undertake no important business unless the omens were favorable. Another way of learning the divine will was employed by the soothsayers (*Haruspices*), who pretended to do so by studying the entrails of animals killed in sacrifice. Besides these were the *Flamens*, who were the priests of particular gods; the *Fetiales*, who were concerned with the relations of Rome with foreign states, and performed the proper religious rites on the declaration of war and the conclusion of peace; and the *Vestals*, the six virgins who attended to the worship of Vesta and kept the sacred fire burning on her hearth.

The Roman worship lacked the vivacity and joyousness of the Greek. It was sober and self-restrained. Deep reverence was paid to the gods, who were stern taskmasters that must be appeased, rather than those half-human deities whom the Greeks treated with serene familiarity. But as the old simplicity of the Roman character disappeared, religion lost its hold on the popular mind. Worship was empty and formal, and it is said that two augurs could not meet on the street without laughing.

Dress. — The distinctive article of Roman dress was the *toga*, a woollen garment, semicircular in form, draped over the shoulders in such a way as to leave one arm free. It was the Roman full dress, and every citizen was expected to wear

it on public occasions. At the age of seventeen a young man assumed the pure white toga in place of the toga with the purple hem, as a token of full citizenship. Women wore a loose over-dress and an inner tunic. On the street a long cloak or shawl of bright colors was worn.

Meals. — In the luxurious days of the later republic and the empire, great attention was paid to the pleasures of the table. The costliness and variety of the food can hardly be conceived. The chief meal was dinner (*cena*), of which the Romans partook

A ROMAN BAKERY

toward evening. At table they reclined on couches, and ate with two pointed spoons instead of knives and forks. At the banquets of the rich, musicians and dancing girls were often brought in to entertain the guests while feasting. Each guest brought with him a linen napkin, which he wore over his breast. Wine was used freely at the feasts, and before the drinking began the guests crowned themselves with chaplets of flowers or vines.

Baths. — The Roman baths were very numerous, and some of them were on a magnificent scale and fitted with every luxury. Every one resorted to them for amusement and for the interchange of gossip. They were provided with libraries and with facilities for playing games.

Education. — The Roman schoolmaster treated his pupils with great severity, using the rod freely. The sons of wealthy parents were accompanied to school by a slave. The elementary branches were reading, writing, arithmetic, and music, but in the higher schools the best works of Greek and Latin authors were studied. Much attention was paid to the study of rhetoric and public speaking. It was common for the Roman youth to finish his education by a course of study at Athens.

Burial. — Like the Greeks, the Romans believed that the souls of the unburied dead were obliged to wander for a hundred years before they were allowed to enter the place of departed spirits. Accordingly, they took great pains in all matters that pertained to burial. The ceremonies preceding and accompanying the interment of the well-to-do Roman were elaborate and expensive. Incense was placed beside the funeral couch, which was decorated with flowers and boughs. The body was kept on exhibition for seven days, after which it was carried to the Forum in a solemn funeral procession, consisting of the nearest relatives, who carried the bier, and bands of hired mourners and actors, the latter by recitation or mimicry recalling the events in the life of the deceased, or his personal peculiarities. Another curious feature of the funeral procession was the band of hired attendants who wore waxen masks representing the features of the distinguished ancestors of the deceased. In the Forum a eulogy was pronounced over the body, which was then taken to the place of burial or to the funeral pyre, for both interment and cremation were customary. If the body was burned, the ashes were collected and placed in a funeral urn. If it was buried, it was usual to employ a stone coffin in which the ornaments were placed along with the body.

MEDIAEVAL HISTORY

CHAPTER XXVIII

THE NEW BARBARIAN KINGDOMS

Value of the Study of the Middle Ages.—The term ‘Middle Ages’ is applied to the period between the fall of the Roman Empire in the West (476 A.D.) and the capture of Constantinople by the Turks (1453 A.D.). It thus embraces nearly a thousand years of the middle ground between ancient and modern history. It used to be thought that this period was one with which the modern scholar need have very little to do, because civilization was at low ebb and the events of a half-savage and ignorant age seemed to have no lessons for those who were fortunate enough to live in the later days of culture and enlightenment. But a deeper study has proved this period to be of the greatest interest to the historical student. It was the time in which the great states of modern Europe had their beginnings, and we never can understand what these nations are unless we study them in their origin and development.

Character of the Middle Ages.—Because the men of this period were ignorant, because the invasion of hordes of barbarians had changed the whole face of the Roman Empire, overturned its elaborate system of government, destroyed its commerce, and caused its art and literature to be neglected and forgotten, we must not think that all progress received a sudden check or that the world stood still for the next thou-

sand years. The outward splendor of the old civilization, to be sure, was gone, but in place of it there were elements which when combined and developed were to bring in a new civilization higher and more lasting than that which had passed away.

The invading tribes learned much from the conquered people. Many of them gave up their barbarous dialects for the language of the Romans. They gave up their wandering habits and learned to live in cities. They copied the Roman system of law, and they cherished the hope of building a great world empire like that which Rome had been.

On the other hand, the barbarians had ideas of personal liberty, of the responsibility of the rulers to the people whom they ruled, which had long ceased to exist in the minds of the slavish Romans under the despotic government of the empire.

Again, the fall of political Rome did not bring with it the fall of the Roman Church. The Church, in fact, rather profited by the change, being no longer overshadowed by the State, but standing forth as the only compact and orderly institution in a world of confusion. As Rome had conquered by force, the Church conquered by the gospel of peace, and soon brought all western Europe into the fold by her steady and vigorous policy of conversion.

These, then, were the influences that tended to shape society in the Middle Ages: Roman ideas preserved in literature and systems of law; Germanic customs and characteristics; and the power of the Christian Church.

Many prefer the date 378 A.D. as marking the transition from Ancient to Modern history, since at that time the migrations began on a large scale, and within the century that followed several of the mediaeval monarchies had their beginning. The date 476 A.D. is on some accounts the more convenient, but it must be remembered that within the limits of Roman Empire four Teutonic kingdoms had already been established; namely, the Visigothic, the Vandal, the Anglo-Saxon, and the Burgundian.

The Founding of the Frankish Kingdom. — In 406 A.D., a large

body of the Franks had crossed the Rhine. From that time they spread slowly over northern Gaul, although they continued to hold their original land. In this respect their movement differed from that of other German tribes, for it was less a migration than a gradual extension of dominion. Perhaps it was because they did not waste their time and strength in useless wandering, but held fast to the good lands they had, that they became the strongest and most progressive race in Europe.

We have nothing but doubtful legends about their early history and we know only that they were ruled by kings called Merovin'gians, from Mero'veus, the mythical ancestor of the line. We do not get into the region of fact till the year 481, when Clovis, the greatest of all the Merovingians and the founder of a powerful monarchy, succeeded to the throne.

Clovis (481-511). — Clovis was young, daring, and ambitious, and to the south of his territory was the fairest and richest portion of the empire. He resolved to put it to the test whether Franks or Romans should possess the country, and with this end in view he marched down into the lands he coveted. In the battle of Soissons in 486 he destroyed the last remnant of Roman power in Gaul, and gained for his people all the lands of modern France as far south as the river Loire. In governing the country which he had conquered, he showed much shrewdness and skill; for instead of letting his people oppress the natives and make enemies of them, as was the usual way with the barbarians, he contrived it so that the leading men among the Roman-Celtic population were friendly to his rule.

The chief means by which he brought this about was his protection of the Church. He and his warriors had no religion in the proper sense of the word. Their belief was a mass of superstitions without system or consistency, a mere matter of signs and omens and unreasoning fear; and the mysterious power and impressive ceremonies of the Christian Church naturally took strong hold of their imaginations. Now Clovis

knew that if the Franks accepted the orthodox faith and made the Church their friend, they would be far better off than any of the other tribes; for the Germans generally had been converted, not to the Christianity taught by the Church, but to what was called Arianism, a form of Christianity which the Church considered an odious heresy no better than paganism itself. As a result, the orthodox Christians and the Arian invaders were forever quarreling in the countries where they lived together.

Clovis then, thinking that he would have an easier time in governing if he were backed up by the Church, was disposed to accept what was regarded as the orthodox faith. A few years after the battle of Soissons, he married a Burgundian princess named Clotilda, a very loyal supporter of Catholic Christianity, who did her best to bring Clovis around to her way of thinking; yet it seemed to be a hard matter for him to give up his old gods, especially when a son who was born to them, and whom Clovis permitted to be baptized, died in infancy.

His conversion finally came about in a rather curious way. He was leading his Franks in a fierce battle with the Alemanni, and the fight was going against him. In his despair he thought his own gods had deserted him, and vowed that if the God of the Christians would grant victory to the Franks, he would forsake his old religion for the Christian faith. Rallying his troops, he made another attack, and this time drove the Alemanni from the field.

True to his promise, on Christmas Day, 496, he was baptized in the presence of a large multitude, and soon afterward thousands of the Franks followed his example. The anniversary of this great event is still kept by Frenchmen, who regard Clovis as the founder of their nation. Its importance consists in the fact that the conversion of the Franks to the Catholic form of Christianity made the strongest of the German tribes an ally of the Church. Both the Church and the Frankish state profited by the alliance. The Roman bishop became the acknowledged head of western Christendom, while

the Frankish rulers gradually built up the most powerful empire in Europe.

There are two more events to be noticed in the life of Clovis. As a champion of the true faith, he attacked the Arian king of the Burgundians, and made his kingdom tributary to his own (500), although the conquest was not completed till a few years later (534). In 507-508 Clovis attacked the Visigoths and drove them almost to the Pyrenees, so that with the exception of a narrow strip north of those mountains the whole of France was in the hands of the Franks. Clovis died in 511.

The Ostrogothic Kingdom in Italy. — In the meanwhile Italy had fallen into the hands of another German tribe. We have seen that Odoacer, the Visigothic chieftain who deposed the last of the Roman rulers in the West in 476 A.D., really had things his own way in Italy, although he was outwardly a mere agent of the Eastern emperor. Zeno, the Eastern emperor, took alarm at this; but, being too weak to restore the imperial power himself in Italy, applied for aid to Theodoric, king of the Ostrogoths, who were then living near the lower Danube.

Theodoric (493-526 A.D.). — Theodoric, like Clovis, was one of the heroes of the early Germans. He had been brought up as a boy at Constantinople, and knew something of the splendor and culture of the empire. He also knew something of its weakness; so he was more than willing to act as the emperor's avenger against Odoacer, hoping to gain for himself and his people the lands which Odoacer ruled. The whole tribe of Ostrogoths moved into Italy in the year 490, and having defeated Odoacer and driven out his followers, established themselves there in their place. The conquest was completed in three years, so the year 493 marks the real beginning of the Ostrogothic Kingdom.

Theodoric had no idea of giving up his conquest to the emperor, and although he rendered him a sort of allegiance, he was really independent, just as Odoacer had been. But he was a much greater and stronger ruler than Odoacer, and his kingdom was more extensive and more powerful; for he did

all he could make the natives friendly to him and to preserve peace between them and his own people. Though an Arian, he did not persecute the Catholics. Though a conqueror, he did not seize all the lands of the conquered, but allotted a certain portion to his followers and allowed the natives to keep the rest. He invited the best scholars of the time to his court and tried in every way to promote learning, though he himself did not know how to read or write. He governed according to the Roman law, which he saw was far better than the rude German system, and his reign was both peaceful and prosperous, but in its closing years he became cruel and suspicious. He thought that Boëthius, the most learned man of his kingdom, was plotting against him, and he had him put to death. His orthodox subjects came to hate and fear him, and after his death, in 526, they took his ashes from the tomb and scattered them. His successors were weak rulers and the kingdom lasted less than thirty years after his death. As a result of the campaign of Belisarius and afterwards of Nar'ses, generals of the Eastern emperor Justinian, Italy was reconquered in 552, and reunexed for a short time to the Eastern Empire.

The Roman Empire in the East. — For fifty years after the fall of the empire in the West, the Eastern rulers had been of little importance; but we now come to an emperor whose reign is well worth notice. Justinian I., sometimes called the Great, ruled from 527, the year following Theodoric's death, to 565, and in the course of these years showed more capacity as a ruler than any other emperor in the East except Constantine. His reign is remarkable both for works of peace and for warlike achievements. Of the former the most important is the reduction to writing of the Roman law, a work involving enormous labor, which he intrusted to the great jurist Tribonian. When completed, this vast collection, containing imperial edicts, principles of legal procedure, and opinions of jurists, formed what is called the Body of the Civil Law, the basis of the law of most European countries to-day.

Another thing he did was to improve architecture. The Church of St. Sophi'a at Constantinople was built in his reign, and many strong fortresses were erected to defend the frontiers of his empire. Then, too, his merchants introduced the manufacture of silk into his dominions, stealing the secret, it is said, from the Chinese. In military matters, also, he knew how to select the right men to accomplish great results. Belisa'rius, his general, entered Africa with a small force and in a short time conquered the Vandals so completely that they disappear as a nation from history from that time forth. The Vandal kingdom was reannexed to the Eastern Empire in 534.

Belisarius was just as successful in Italy, but there his success provoked the jealousy of Justinian, who recalled him and allowed another able general, named Narses, to complete the conquest (552). There are a great many stories about the ingratitude of the emperor to Belisarius, and according to one account this brave and skillful general, who, even after he had been unjustly recalled, saved Constantinople from the barbarians, was deprived of his eyes and reduced to the condition of a beggar. This may be doubted, but it is certain that he was very ill paid for his great services.

Justinian died in 565. Only one emperor after Justinian did anything really remarkable. This was Herac'lius, who is noted for his military exploits in his campaigns against the Persians. He defeated the Persian king at Issus in Asia Minor, and again at Nin'veh after a wonderful march into the heart of the enemy's country. He is classed with the world's great generals, but he accomplished nothing that lasted, and after his death, in 641, the territory of the empire was greatly curtailed. From this time till the fall of Constantinople, in 1453, the doings of the rulers in the East will have very little interest for us, and we shall notice them only when they have some connection with events occurring in the West.

The Kingdom of the Lombards in Italy (568). — The Lombards (or Langobards, the long-bearded people) were the last tribe to settle within the limits of the ancient Roman Empire. When

Justinian died, Narses, who had completed the work begun by Belisarius in Italy, was ruling at Ravenna as the representative of the empire; but he soon found that his enemies at Constantinople were plotting to have him recalled. The imperial power was at that time in the hands of a woman named Sophia, who listened to the slanders of his rivals, and finally decided to call Narses back, sending him word that his proper place was "with the women in the palace, where a distaff should be placed in his hand." On hearing of this, Narses replied angrily that he would "spin her a thread that she would never unravel in her life," and he straightway sent word to the Lombards, who were then living in Pannonia, that, so far as he was concerned, they would be welcome in Italy. Accordingly, the whole nation marched down and, in 568, set up a kingdom in Italy. Thus the restored power of the empire over Italy lasted just sixteen years, from 552 to 568.

These Lombards were harder rulers at first than the Ostrogoths had been. They were Arians and persecuted the Church. Their savage character is illustrated by a story that is told of their chief Al'boin. Alboin had married Rosamund, daughter of a Gepid chieftain whom Alboin had killed in battle, and on the occasion of a feast he offered her wine to drink in a cup made of her father's skull. Rosamund promptly avenged the insult by causing his murder.

Conclusion. — The invasion of the Lombards in 568 brings us to the end of the period of the migrations. In the 190 years between 378 and 568 there were gathered in the lands that had belonged to the Roman Empire a motley crowd of barbarians who left very little of the old order of things. They were the material out of which the new nations of Europe were formed. It now remains to trace the early history of these nations, and to show their relations with each other and with the Christian Church.

CHAPTER XXIX

THE KINGDOM OF THE FRANKS

The Merovingians and the Mayors of the Palace. — The family of the Merovingians, after producing one great man, seemed to degenerate, and the successors of Clovis were weak or vicious men who let the royal power slip from their grasp and pass finally into the hands of a new dynasty. It would have been a hard task even for a strong and able ruler to enforce his authority over the Franks; for they, like the other Germans,

were extremely restive under royal control. Clovis himself found it difficult to manage them; for at first they viewed their king merely as one of themselves chosen to lead them in time of war. Their spirit is illustrated by the famous story of the vase of Soissons. Clovis, after gaining a victory over his enemies, reserved a beautiful vase as his share of the spoils; but one of his warriors, angered by the king's assuming a right which the others did not possess, broke the vase to pieces with his battle-ax. For this he was slain; but the story shows how hard it was for the rude Franks to view their king as having any special rights or authority.

FRANKISH FOOT SOLDIER

The descendants of Clovis spent their time in idleness or, worse yet, in bloody feuds with members of their own family, while the royal power constantly diminished. In the reign of Dag'obert (628-638), who seems to have had more ability than any of the others, there was a brief interval of vigorous gov-

ernment, but he was followed by rulers as bad as those who had preceded him. Those who came after Dagobert are known as the Do-Nothing Kings (*rois fainéants*), and the period of their misrule is one of the darkest in history.

As the king's power decreased, his officers became stronger and more independent. Next to the king the highest officer in the country was he who bore the title 'Major Domus' or Mayor of the Palace, and whose duty consisted originally in looking after the affairs of the king's household, but afterwards included very important functions of state, corresponding roughly to those of a Prime Minister in modern times. In the latter part of the seventh century the office of Mayor of the Palace of the Eastern Franks became hereditary in the great family of the Pep'ins, who gained power at the expense of the king and finally under the name of the Carlovingians occupied the throne. Pepin of Heristal, as Mayor of the Palace, ruled over the Eastern Franks as if he were their king, and by the victory of Testry, in 687, extended his authority over the Western Franks as well. So he ruled over the entire kingdom with very little regard for the nominal king.

Charles Martel (714-741). — Charles, the son and successor of Pepin of Heristal, was a great fighter, and his reign was almost wholly taken up with wars. There were enemies on all sides, and but for his unceasing efforts the kingdom would have been overrun by barbarous hordes. One great obstacle in his way was the independent spirit of the nobles, who during the decline of the royal power had come to feel that no one had any right to make demands on them.

Since he could not force their obedience, he determined to buy it, and the only way he could manage this was by taking the lands of the Church. He seized a considerable amount of church property and granted it to fighting men on condition that they should aid him in his wars. This was an offense which the Church never forgave, but it was the only means open to him, and the time soon came when he needed all the forces he could raise to save Christendom from destruction; for

the Mohammedan Saracens had conquered Spain and were pouring into southern France. They had conquered Africa, Asia Minor, and the East, and now they were bent on conquering all of Europe. It seemed as if they must succeed, for they had been uniformly victorious. They had advanced far into the interior of the Frankish territory before Charles could stop them, but in the plains between the cities of Tours and Poitiers he met them in a great battle and gained a complete victory, 732.

The battle of Tours is one of the most important battles of history, for it decided whether Europe was to be Christian or Mohammedan. The heavy blows which Charles struck on this day on behalf of his country and his Church gained for him his surname of Martel, that is, the Hammer. After this no one questioned his power. He was in effect king of the Franks, and yet he did not assume the kingly title, but allowed the insignificant Merovingian to wear the crown.

By this time the Merovingian kings had sunk to the position of mere puppets of the Mayors of the Palace. Once a year they were clad in royal robes and carried in an ox cart to the National Assembly, where they recited a speech which was put into their mouths, received ambassadors, and exchanged compliments with their officers. Then they were carried back again and shut up in their palace till the time came to repeat the solemn farce.

Pepin the Short (741-768). — Charles Martel's extraordinary energy and ability were inherited by his son Pepin the Short. All power was concentrated in the hands of the Mayor of the Palace, and revolts were crushed out with promptness and severity. At last the time came for the assumption of the royal title; but Pepin was cautious. He asked the pope (the Bishop of Rome) whether it was a good thing that one man should have the title of king without the power, while another had the power without the title. The pope replied that the man who had the power ought also to have the title. Soon afterwards the last of the old line of kings was shorn of his long hair, which was regarded as the sign of royalty, and was

confined in a monastery. Pepin was then crowned king with the sanction of the pope (752). Thus ended the Merovingian line. The new dynasty of the Carolingians or Carolingians thenceforth ruled over the Franks.

The pope had a good reason for the favor he had shown Pepin in the matter of his coronation; for he was at that time threatened by a powerful enemy and needed the aid of the Franks. The Lombards wanted to extend their power over all Italy, and after seizing the city of Ravenna and the adjoining district, their king Aistulf demanded that the pope should acknowledge his supremacy. Pope Stephen in great distress crossed the Alps and in person begged Pepin to come to his aid. While at the king's court he repeated the ceremony of coronation, thus seeming to establish the principle that the popes alone could bestow the crown and were therefore superior to the temporal ruler. Pepin granted the pope's request and in two expeditions against Aistulf won back all that he had seized.

Then he took a step that had very important results. He not only secured the pope in all that he had formerly possessed, but he made him sovereign over an extensive strip of land in northern Italy, promising that he and his successors should rule this land forever. This was the famous Donation of Pepin, by which the popes gained possession of what are known in history as the Papal States and became civil rulers like the kings of France or Germany. But for Pepin's assistance, the Lombards would have obtained all Italy, and the pope would have been merely the head of the Church, just as he is to-day. But as it was, Italy was under a divided government for 1100 years; for it was not till times very near our own that another king of Lombardy, Victor Emmanuel, succeeded in doing what Aistulf had attempted, and united all Italy under his sway.

Pepin died in 768, after gaining almost every object that he had worked for. He was a singularly wise and vigorous ruler. Nicknamed 'the Short' from his small size,—he is said to

have been only four feet and a half in height, — he nevertheless seems to have been both strong and brave. There is a story that when looking at a combat between a lion and a bull he asked his courtiers if there was any one among them who dared to separate the two animals. When no one volunteered, he jumped into the arena himself and killed both the lion and the bull. After this no one laughed at him for being "a little man." This is probably an invention like a good many of the other tales about him, but it is very significant as showing the respect in which he was held. Men do not invent such stories about weak and cowardly princes.

The Character of the Period.— During all these years between the death of Clovis in 511 and the death of Pepin the Short in 768, the Franks had been making progress in civilization, but this progress was slow. The need of the times was for fighting, since, until they secured themselves against attacks, they were likely to be swept back into barbarism by an invasion of tribes less civilized than themselves. Under the later Merovingians this fighting energy was spent in useless wars among themselves rather than in extending and strengthening their frontiers; but men like Charles Martel and Pepin the Short turned it to better account, and by their ability built up a kingdom which the genius of their great successor Charlemagne was able to make into a powerful empire.

One great difficulty which the king had to overcome was the tendency of the nobles to make themselves independent. Weak kings could not check this tendency, and we have seen that even Charles Martel had to buy the services of his nobles by grants of land. Both Charles and Pepin strove with all their might to keep the nobles under their control, and they succeeded in greatly strengthening the royal power; but just as soon as an inefficient ruler comes to the throne we find the same force at work again, and it was destined to divide the state into little countships and duchies almost independent of the king. In other words, in this tendency we can trace the beginning of that condition of things which we call Feudalism (chap. 36).

Another very important fact about this period is that it was the time of the conversion of Germany to Christianity. The Frankish kings were strong friends of the Church, and they did all they could to convert the barbarians around them. St. Boniface, called the Apostle to the Germans, was aided in every way by Charles Martel and Pepin. He carried the Gospel to the barbarous tribes living north of the Franks and along the shores of the Baltic Sea, and as fast as he won them to the faith he established bishoprics among them and brought them under the spiritual rule of the pope. With his own hand he cut down the sacred oak at Geismar, which they held in superstitious reverence, believing that the anger of their gods would send a terrible punishment to any one who injured it. When no lightning fell from heaven to avenge this deed, many of them accepted the faith of Boniface. He closed his career with martyrdom, being slain by the Frisians, whom he was trying to convert.

CHAPTER XXX

CHARLEMAGNE

Charlemagne's Inheritance. — At Pepin's death in 768 the kingdom of the Franks included the greater part of what is now France, together with a portion of Germany. This territory was divided between his two sons, Carloman and Charles, who ruled over it together for three years, until 771, when, by the death of Carloman, Charles became the sole ruler. Charles, or to give him the title by which he is best known, Charlemagne (that is, Charles the Great), is the greatest figure in the history of the Middle Ages, and one of the ablest rulers of all time. His reign is itself an epoch in history; for the work he

did lived after him, and influenced the nations of Europe for centuries to come.

From the first his object seems to have been to unite all German peoples in one great empire, and then to make that empire so strong that it would last forever. It was a work of enormous difficulty. On his accession he found his territory threatened by many enemies. To the north and east were the Danes and Saxons, who had not yet become civilized or converted to Christianity. In the region north of Italy were the Bavarians, who, although their duke had acknowledged Pepin as his overlord, were ready to assert their independence at the first chance. East of them were the Avars, a savage heathen race akin to the Huns. In the valley

PORTRAIT STATUE OF CHAR-
LEMAGNE, IN PARIS

of the Po and to the north and northwest of Italy were the Lombards, enemies alike to the pope and to the Franks;

and in the southernmost part of France, on the Spanish border, were the Saracens. Add to these the Slavonic tribes of northern Germany, and the long list of Charlemagne's enemies is complete. With every one of these peoples he was called upon to fight; and some idea of the amount of fighting he had to do can be had from the fact that in the course of his reign he directed fifty-three separate campaigns. It is possible here to give only the main results of all these wars.

Charlemagne's War with the Lombards. — The Lombards were no longer Arians. They had gradually come to accept the form of Christianity which was represented by the pope at Rome, but their belief in the pope's religion did not incline them to respect what he considered his rights to the lands of the Church. They wanted these lands for themselves, and Pepin's punishment of their king, Aistulf, for an attempt to seize them was soon forgotten. Deside'rius, who was king of the Lombards at the time Charlemagne was ruling the Franks, renewed the claim to the papal territory. The pope applied to Charlemagne for aid, just as he had applied to Pepin before. Charlemagne responded very willingly, and appeared in Italy with so powerful an army that the Lombards were too badly frightened to resist, and Desiderius was taken prisoner almost without striking a blow in his own defense. Charlemagne shut him up in a monastery, crowned himself with the iron crown of the Lombard kings, and thenceforth ruled over Lombardy, styling himself King of the Franks and Lombards.

Thus, in the year 774, the Lombard kingdom came to an end, after lasting a little over 200 years; and from this time the German kings and emperors had a claim on Italy as a part of their inheritance. It now remained for Charlemagne to give back to the pope the lands which the Lombards had taken from him. This he did in the most solemn manner, taking an oath that he would protect the pope in the possession of all his lands, and formally renewing the gift of Pepin.

The Saxons. — Two years before the Lombard conquest, Charlemagne began the first of a long series of campaigns

against the Saxons. Of all his foes they were the bravest and the hardest to subdue. It took over thirty years to complete the conquest. Living along the lower courses of the Rhine and Elbe and in the country between those rivers, they had not come in contact with the Roman civilization, nor had they given up their old pagan worship for the Christian faith. In fact, they were at about the same stage of development as that of the Franks four centuries before.

Now that the Franks had become civilized, the presence of these lawless plunderers on their borders was a constant source of trouble, and at the same time it was thought to be the duty of a Christian people to bring their neighbors to the true faith, even if conversion could be accomplished only by force. So Charlemagne felt that he was serving his own interest and doing his duty to the Church at the same time when, in 772, he entered on his war with the Saxons.

The details of his many campaigns against them are not known, but the general results of his expeditions seem to have been about the same. He would lead a large army into their territory, frighten them into submission, and then withdraw, thinking that he had conquered them; but as soon as his back was turned, revolts would break out in another part of the Saxon country, and he would have it all to do over again. Thus, after a successful campaign in 772, when he entered their country and made them swear obedience to his rule, he turned his attention to the Lombards, but returned from Italy only to find the Saxons in open rebellion; and when he thought he had subdued them a second time in 776 and started off to punish the Saracens in the south, they again revolted.

In this second revolt their leader was Wid'ukind, who for years held out against the Franks, and on one occasion won a decisive victory over them — a victory, however, which provoked Charlemagne to a very cruel revenge; for he took a large force into their country, and having as usual forced them to submit, required them to send to him all the warriors who had taken part in the revolt under Widukind. The Saxons

dared not disobey, and in a short time gave up to him 4500 of their fighting men. Charlemagne gathered these prisoners at Verden and massacred them all.

It would be hard to conceive of a more cruel act than this, and it is certainly a very dark page in the history of this great prince; but it must be remembered that it was a barbarous age, and that Charlemagne was dealing with a savage race, which could be governed only by fear. He had tried mild methods hitherto, and they had had no effect. It is probable that he hoped by this one act of cruelty to strike such terror into the Saxons that they would lay down their arms forever; but it had just the opposite effect, for the whole people united again under their brave leader Widukind, and fought more desperately than ever. Gradually, however, their strength gave way before the repeated attacks of the Franks, and each campaign left them in a worse condition to meet their enemies. Widukind lost all hope and surrendered himself to Charlemagne in 785, after which he is heard of no more in history. He had been the soul of the resistance, the ablest and bravest of all the Saxons, and there was no one fit to take his place; but revolts continued to break out at intervals, and the country was not thoroughly subdued till 804.

The conquest of the Saxons carried with it their conversion to Christianity, for Charlemagne believed in Christianizing by force. He spread the Gospel as far as he carried the sword, and obliged the conquered people to be baptized under the fear of death. As fast as he gained Saxon territory, he established bishoprics and enforced the strictest obedience to the representative of the Church, punishing by death any act of sacrilege or of violence toward the clergy. The laws were very severe, and the death penalty was inflicted for what seem to us comparatively slight offenses; but by these very means he increased the power of the Church, for it was provided that any Saxon who had committed a crime could save himself from the sentence of death by confessing his deed to a priest. His policy was very successful. The Saxons were soon the most devout of

churchmen, and at the same time they became the most loyal subjects of the empire.

The Bavarians. — Tassilo, Duke of the Bavarians, had acknowledged Charlemagne's father, Pepin, as his chief, but had continued to rule without much regard to the king of the Franks. His territory bordered on the Frankish kingdom and on the lands of the Lombards whom Charlemagne had subdued, so that if it were annexed to the Frankish state it would give Charlemagne control of all the country as far east as the Danube. Charlemagne at first demanded that the Bavarian duke should acknowledge him as his overlord. Tassilo dared not refuse, but soon afterwards showed a rebellious spirit, and even asserted his independence. Thereupon Charlemagne promptly marched into Bavaria and forced the duke to acknowledge his supremacy a second time, in 787. A little later he deposed him altogether and shut him up in a monastery, thus putting an end to the Bavarian line of rulers. In this way another strong German people was united with the Franks, whose rule now extended from the Atlantic Ocean as far east as Bohemia, over regions occupied wholly by Germanic tribes.

Saracens, Slavs, and Avars. — Charlemagne now had to deal with certain non-Germanic peoples who were threatening his borders. These were the Saracens, Slavs, and Avars. The Mohammedan Saracens, or Moors, had gained possession of nearly all Spain, but there were still small fragments of the ancient Visigothic kingdom in the north. It was to save these little Christian states from their Mohammedan oppressors, as well as to round out

SARACEN ARMS

the limits of his own kingdom, that Charlemagne undertook a campaign against the Saracens.

Without much trouble he drove the Saracens beyond the Ebro, and made that river the southern boundary of his dominions. On his way back the rear guard was attacked in the mountain pass of Roncesvalles, and some of his bravest warriors were killed — among them Roland, whose exploits are celebrated in the famous *Song of Roland*, which has come down to us from the Middle Ages; but the deeds of Roland are more a matter of legend than of history, for all that we know positively about him is that he perished in the fight at Roncesvalles. This battle did not regain for the Saracens what they had lost; for so long as Charlemagne lived, the sway of the Franks extended to the Ebro.

The Slavs lived in the lands east of the river Elbe, and in the country now called Bohemia. Charlemagne found it easy to subdue them, but not so easy to keep them in subjection; for they were a rude, unruly people, constantly fighting with the Germans on the border. The Avars occupied the country east of Bavaria, and kept the Bavarians busy in defending themselves from their attacks; but Charlemagne brought them to terms in a single campaign in 791.

Charlemagne's Dominions. — At the close of the eighth century Charlemagne's dominions extended from the Atlantic Ocean on the west to modern Hungary on the east, and from the Baltic Sea to the river Ebro in Spain. They covered as much ground as the western division of the old Roman Empire. All this territory was occupied by Germanic peoples, many of whom, before the time of Charlemagne, were wholly independent of the Franks.

Restoration of the Empire. — Yet Charlemagne still had only the title King of the Franks and Lombards. To the men of that day it seemed natural that the ruler of this vast territory, which was, in fact, an empire, should receive the title of emperor; for his power was far greater than that of the ruler at Constantinople, who was still called Roman Emperor. It seemed as if the empire in the West had, in fact, been restored; but instead of being Roman, as before, it was now

German from one end of it to the other, although in the southern portions, in France, Spain, and Italy, there was a strong Roman element in the population. But the question was, how was Charlemagne to obtain the title of emperor? Should he assume it himself, and if not, by whom should it be given to him? The matter was settled in the following way.

The popes, as we have seen, were strong friends of the Franks, from whose kings they had received many favors in the past and hoped for more in the future. At the same time

they had become enemies of the Eastern Roman emperors, who were still the nominal rulers over Italy and the West, although no one respected their authority in those regions. The Eastern and Western churches had divided on questions relating to the worship of images and other matters, and the emperors had often tried to curtail the powers of the popes. So by restoring

the empire in the West and giving the crown to the king of the Franks the Church would secure a protector against any encroachments from Constantinople.

Charlemagne crowned Emperor. — Such was the condition of things in the year 800. On Christmas Day of that year Charlemagne was in Rome, attending the services at St. Peter's; while he was kneeling in prayer, Pope Leo III. suddenly approached him, placed on his head a golden crown, and saluted him as emperor. This act was regarded as the restoration of the Roman Empire, and Charlemagne was hailed as the successor of the Caesars, although there had been no Caesars in the West for over 300 years; that is, since 476.

It seems strange to us that the people of that day could regard this as in any sense a Roman Empire, but they did; and what is more, this idea of a great imperial government extending over all Europe possessed men's minds for many centuries, for it was not till modern times that people came to believe that each nation should be left to govern itself in its own way. The lands that Charlemagne ruled passed through many changes after his death, but his successors in Germany were called emperors of the Holy Roman Empire, and this title was held by them till the year 1806.

Rome was the capital of this restored empire, and Italy belonged in theory to the successors of Charlemagne on the German throne. As a result, the German emperors were continually engaged with Italian affairs to the neglect of their national interests, and neither Italy nor Germany developed a strong, centralized government till centuries after the states of western Europe had reached that stage. Another thing to be noted is the fact that the pope crowned Charlemagne. This seemed to imply that the pope was superior to the emperor, and that no emperor's title was valid unless sanctioned by him. Thus there was established a precedent for later popes to assert the claim of supremacy over all earthly rulers in temporal as well as religious matters, a claim which led to a long and bitter conflict between emperors and popes. So it is clear that this coro-

nation of Charlemagne had some very important and lasting effects.

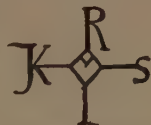

German Independence. — Charlemagne died in 814. During the fourteen years that followed his coronation, he applied himself to the work of building up a strong centralized government and improving the condition of his people. To centralize the government, that is, to get all the power into the hands of the emperor, was a hard task; for the Germans had always been very jealous of any attempt to restrict their freedom. They believed in an exactly opposite kind of government,—one in which power did not come from the king, but from the people gathered in their national assemblies. The idea of the Roman Empire was that all authority came from above; that is, from the emperor. The idea of the Germans had been that all authority came from below; that is, from the freemen. Moreover, the Germans were inclined to form little states under dukes or counts who were virtually independent.

Charlemagne's Government. — Charlemagne tried to check this tendency by making every one take an oath of allegiance to him and by appointing the officers who should rule for him in different parts of the country, but there was danger that these officers would usurp some of his authority and come to regard themselves as ruling in their own right. This was especially likely to happen on the frontier or mark, where the local count or margrave was constantly fighting with enemies across the border and perhaps winning new lands by conquest. To meet this difficulty, Charlemagne created a set of officers, called the *Missi* (messengers), whose duty it was to visit all parts of the country, and bring back reports of what the various governors were doing. By these means and, above all, by his great personal energy and the awe that his name inspired, he held his vast dominions together and made his will supreme.

But his work was not lasting; for his successors were not great enough to keep it up, and we shall find that after his death the tendency towards separation and independ-

ence proved too strong to be controlled, and finally resulted in that division of Europe into petty countships and dukedoms which is the characteristic of what is called the Feudal System.

Charlemagne's Influence on Literature. — One of the best proofs of Charlemagne's greatness is the fact that in a barbarous age, when fighting seemed to be the only object in men's lives, he saw so clearly the advantages of education, and did so much to encourage learning. According to the standard of those times, he himself was a learned man; for he read and spoke Latin, is said to have understood Greek, and was familiar with some of the best writings of scholars, although he never learned to write even in his native German language. He called learned men to his court and lived in daily intercourse with them, discussing all sorts of subjects on which he thought they could give him information. Alcuin, the famous English scholar, lived at his court, and Eginhard, who wrote *The Life of Charlemagne*, was his secretary. In fact, all the great literary men received encouragement from him, and he did an important literary work himself by making a collection of German popular songs.

CHARLEMAGNE'S SIGNATURE.

(Only the central portion was made by Charles, the other letters, forming the name Karolus, being written by a secretary.)

Education. — But the work he did directly for education was the most important. He established a school at his own residence, called the School of the Palace, for the education of his family and all who were attached to the court, and he required every monastery to maintain a school, where the monks were to give instruction to the youth of the neighborhood, especially to those entering the priesthood. He seems to have valued learning and industry more highly than noble birth; for his biographer tells a story about his returning after a long absence to a school which he had founded and promising high offices and rich rewards to the lowborn scholars who had done good work, while for the noblemen's sons who had idled away their time he had only harsh words, saying that he cared little

for their "pretty looks and noble birth, though others think them so fine," and that they should have no favors from him unless they worked to deserve them.

Character of Charlemagne. — He himself was the busiest and most energetic man of his time. No detail seemed beneath his notice, and he managed everything in his empire, from the affairs of his own household to the government of the most remote districts. In size and strength he was a giant, and he was fond of testing his powers by the hardest kinds of exercise. He was simple in his habits, and hated drunkenness, which was the prevailing vice of the Germans. At table it was his practice to have some one read aloud to him from some standard work on history or religion, his favorite book being St. Augustine's *City of God*.

Results of his Reign. — In general, he was generous and kindly in all his relations, both as a ruler and as a man, and his biographers have much to say of the mildness that characterized his dealings with friends and foes alike. He was something more than a mere conqueror; for he aimed to civilize as well as to subdue, and he saw that he could do this best by limiting his empire to peoples of the same race. What he did was to gather the German peoples of Europe together, make them conscious of their kinship, and teach them a lesson in civilization which they never forgot, although the empire which he founded soon passed away.

Division of the Empire. — In the reign of Charlemagne's weaker son, Louis the Pious, the empire began to go to pieces, and on his death it was divided between his three sons, one of whom was called emperor, but ruled over only a small portion of the original empire. Under these Carolingian emperors and kings, the successors of Charlemagne, we shall trace in a later chapter the beginnings of modern France and Germany.

 CHAPTER XXXI

RISE OF THE PAPAL POWER

The Early Christian Church. — At first the apostles of Christ were the governors of the Church. Under the apostles the bishops, or elders, directed the affairs of the congregation of believers. Following the death of the apostles, there was a period lasting many years, during which we have very scanty records of church history, and when in the second century A.D. the sources of information become more complete, we find

that the bishops are regarded as the successors of the apostles, and have authority over several congregations.

Church Government. — At the head of every Roman province was a provincial governor, who controlled the governors of the smaller divisions of the province. In like manner there arose among the bishops of a province one who possessed authority over the rest. He was called an Archbishop or Metropolitan Bishop. Finally, in some of the great cities the heads of the Church acquired authority over all the church officers in that region and became what were called Patriarchs. There were five great Patriarchates, whose capitals were Rome, Constantinople, Jerusalem, Antioch, and Alexandria. Next came the archbishops or metropolitan bishops, then the bishops, and finally the priests, who were the heads of single congregations.

Rise of the Christian Church. — In the meanwhile the Church had risen from the position of a poor and obscure sect, holding its meetings in secret and suffering continual and bitter persecution, to a state of dignity, power, and wealth. In the eyes of the Romans a Christian had been regarded as a criminal, for he detested their gods and refused to believe in the divinity of their emperors after death. He was a member of an illegal association, and as such liable to the severest punishments. But in spite of every kind of persecution, the Church grew in numbers and power till, as we have seen, Constantine granted it full legal toleration in 313. From this time on its power increased year by year.

PAPAL EMBLEMS

Power of the Bishop of Rome. — In speaking of the Roman bishop we shall often refer to his spiritual power as distinguished from his temporal power. By the first is meant his authority in matters of church gov-

ernment and doctrine, his power to bind men's consciences and decide finally on questions of belief. Temporal power, on the other hand, means the same kind of authority as that exercised by kings or magistrates, and pertains only to worldly matters. By various means the Roman bishops secured both these kinds of power. They were both spiritual directors and civil rulers.

It is important to understand how they came to possess this vast authority. The chief ground of the Roman bishop's greater power was the belief that St. Peter had founded the Roman Church and was himself its first bishop. As St. Peter was the 'Prince of the Apostles,' so the Roman Church was regarded as superior to the other churches. Another thing which gave the Roman bishops an advantage over all others was the awe which people felt for the city of Rome, as the capital of the world. It was natural that the bishop of the Roman diocese should be regarded as more important than the head of the Church in some minor city.

Then the emperors had removed from Rome to Constantinople, and the Roman bishop was not overshadowed by the presence of a more imposing personage than himself, nor was he liable to be interfered with so often as if the emperor had been close at hand. When the empire was destroyed, the Bishop of Rome was the only great representative of law and order in the West, and was obliged to exercise much of the authority that had formerly belonged to the emperor.

The Early Popes. — These are some of the circumstances that tended to build up the papacy, but much was due to the personal character of some of the early bishops, and to the great services the Roman Church had rendered to Christianity and civilization. Leo the Great (440-461), the pope whose prayers induced Attila to spare Rome, was a man of extraordinary ability and devotion to the Church, and he bent all his energies to winning for the Roman bishop a position of authority over the whole Church. Another singularly able pope was Gregory the Great (590-604), whose missionary, Augustine,

began the conversion of the Anglo-Saxons (596). Men like these made the office venerable, and people turned to the Roman bishop as the final authority on church matters. In fact, from the time of Gregory the Great we may apply to these bishops the higher title of pope (Lat. *papa*, father), for their power was greater than that of any other ecclesiastical officers in Christendom.

Temporal Power of the Popes. — The influences above described tended chiefly to increase the spiritual power of the popes, but there were some forces which affected mainly their temporal power. In the first place, they became large owners of land, through the piety of wealthy Christians, who, on dying, left their estates to the Church. In the same way they acquired much property of other kinds, and increase of wealth brought increase of power. Moreover, they took their place in the feudal system, and feudal privileges were granted to them as to other vassals (chap. 36).

Donations of Constantine and Pepin. — The most magnificent gift of land was what was called the Donation of Constantine. According to the story, the Roman Emperor Constantine was miraculously cured of the leprosy by Pope Sylvester, and in his gratitude gave the pope the right to rule over all Italy. Furthermore, it was said that Constantine's motive in moving his capital from Rome to Constantinople was that the popes might not be hampered by the presence of an emperor in the West.

A more substantial basis for the temporal power of the popes, however, was Pepin's donation of the strip of land in northern Italy, a gift which was afterwards renewed by Charlemagne (pages 215, 219). This land was the nucleus of the Papal States, which the pope governed as a civil ruler. The popes not only gained lands which they governed in their own right, but they gained certain important powers in the lands of other sovereigns. For instance, in the matter of punishing the crimes of the clergy, the popes claimed that their courts alone had jurisdiction, while the king or emperor held that as the

clergy were his subjects, they should be tried by his courts. As we shall see later, the conflicts arising from this and other disputes between the popes and the civil rulers of Europe, played a prominent part in mediæval history.

The Isidorian Decretals. — The papal claim was greatly strengthened by the so-called Isidorian Decretals, a collection of documents which appeared about the middle of the ninth century, and some of which appeared to show that from the earliest times the popes had actually exercised all the rights which they claimed in later times.

The Papacy in the Ninth Century. — Before the end of the ninth century the papal power had become very extensive, as is evident from the following illustration. Lothair II., king of Lotharingia, had grown tired of his wife Teutberga and sent her away after accusing her of all manner of horrible crimes. He wished the Church to legalize the divorce and permit him to marry another. Two councils of the German clergy, being afraid to decide against his wishes, agreed that Teutberga was guilty of the crimes charged and that he might lawfully divorce her. The pope did not hesitate to set aside the decision of both these councils and declare the king's act illegal. He then made Lothair take back his lawful wife. If a pope could discipline a king in this way and decide upon the legality of his acts, it is evident that the power of the papacy had already become well established.

Monasticism. — During the persecutions of the early Church many left the cities and took refuge in the mountains or in the desert, where they led lonely lives, but at least found safety and peace. At the same time many sought those places of their own free will, from a desire to escape the temptations of the world, and to give themselves up wholly to religious meditations and prayer. The deserts of Egypt were the earliest resort for this class of people; some of them, called hermits or anchorites, dwelling entirely alone; others, known as monks or cenobites, living together in small bands. Their aim being to rid themselves of all worldly thoughts and desires and fix their

minds solely on the next world, they resorted to the severest kind of penances, thinking to kill the desires of the flesh by torturing the body.

These self-inflicted punishments were carried to a point that is almost inconceivable to the modern mind; for the voluntary endurance of suffering seemed to them a proof of the highest virtue and a guarantee of salvation in the world to come. It is told of St. Macarius of Alexandria that he lived for six months in a marsh and exposed his naked body to the stings of insects. Other saints would starve themselves for months; carry heavy weights of iron wherever they went; live in the vilest kind of dens—holes in the ground or caves; go without sleeping and without washing.

The idea that saintliness was measured by suffering had a firm hold on men's minds. A very famous saint, named John, is said to have spent three years leaning against a rock. He never lay down, and his only nourishment is said to have been the Sacrament, which was brought to him on Sundays. But most famous of all was St. Simeon Styli'tes, the Pillar Saint, who stood for thirty years on the top of a column, in all kinds of weather, continually bending his body in prayer. Pilgrims came to see him from far and near, and he had several imitators.

The Benedictines.—But all this applies especially to the early period of monasticism, and chiefly to the form of it that flourished in Egypt and the East. In the West the system showed a more practical tendency. There the order founded by St. Ben'edict (480–543), and called after him Benedic'tine, did good work in the cause of civilization. To the usual vows of chastity, poverty, and obedience was added the rule that the monks must work in the fields during a part of each day. As a result, the best-cultivated lands of Europe were those around the monasteries, which thus set a good example to the people, and improved the methods of agriculture.

The Monasteries and Learning.—The monasteries rendered a great service to learning by preserving and copying the writ-

ings of classic authors. They were, moreover, the charitable institutions of the time, caring for the poor and the infirm, and giving shelter to travelers. But one thing especially deserves attention. They were staunch supporters of the papacy and greatly aided in advancing its power; for a monk was, in a sense, a soldier of the Church. Without wife or children to bind his interests with those of the people among whom he lived, his whole devotion was centered in the Church.

CHAPTER XXXII

EUROPE UNDER THE LATER CAROLINGIANS

The Later Carolingians. — The descendants of Charlemagne ruled in Germany till 911, in France till 987, but in all these years the family did not produce a single prince capable of carrying on the work begun by their great ancestor. To be sure, the work of holding the empire together became far more difficult as the years passed, on account of the tendency to separation and subdivision of its parts; but these kings, with

few exceptions, were feeble rulers, whose very names seem to indicate the slight regard in which they were held, for they have come down to us coupled with disrespectful nicknames, such as 'the Bald,' 'the Fat,' 'the Stammerer,' 'the Simple,' 'the Do-Nothing,' and 'the Child.'

Division of the Empire. — Charlemagne had the old German idea that each son must inherit a portion of his father's land. Accordingly, in his lifetime he divided his empire between his three sons, thus setting an example for the very thing he wished to avoid; namely, the breaking up of the great empire which he himself had taken such pains to hold together. But the death of the two elder sons left Louis, surnamed the Pious, the sole heir to his father's dominions.

Louis the Pious. — Charlemagne himself is said to have placed the imperial crown on his son's head. Whether this is so or not, it is certain that Louis was not in the first instance crowned by the pope, and that on his father's death in 814 he succeeded to all the latter's power without the express sanction of the Roman bishop; but Louis was a strong friend of the Church, and seems not to have regarded his coronation as valid, for he soon afterwards had the pope recrown him. Thus both Charlemagne and Louis the Pious received their crowns from the pope, giving color to the later claims of the papacy to superiority over the empire.

Character of Louis. — Louis had many virtues as a man, but they were not of the kind to make him a good ruler. He was gentle and humane, but lacked force of character. He could not hold either his sons or his nobles to obedience, and he gave himself up completely to the influence of his advisers; so that in complying too much with the wishes of one person, he would often forget the rights of another.

Quarrels with his Sons. — Almost all his reign was taken up with quarrels with his sons about the share of the empire which each should inherit; for, like Charlemagne, he seemed to think that the empire must be divided. In the first place, he gave his eldest son Lothair the central part of the empire,

including Italy. This was by far the largest share, and besides this Lothair was to receive the title of emperor. Naturally the younger brothers, Pepin and Louis the German, felt aggrieved, and matters were further complicated by the birth of a fourth son, Charles (afterwards known as Charles the Bald), for whom a share had to be found.

The Field of Lies. — The attempts of Louis the Pious to carve out a kingdom for Charles by taking from the lands of the others involved him in continual disputes. First one and then another would think himself unfairly treated and threaten to revolt. On one occasion the three elder sons joined forces and prepared to meet their father in battle. For three days the two armies stood face to face, but Lothair won over his father's followers by fair promises and the old emperor, finding himself deserted by his troops, was forced to yield. This scene of treachery and shame is known in history as the Field of Lies.

Finally Pepin, whose share included part of what is now France, died, and Charles the Bald obtained all the western part of the empire. Lothair held almost all the rest, and Louis the German had little more than Bavaria for his share. This was the state of things when the miserable reign of Louis the Pious came to an end. This prince had shown himself utterly incapable of dealing with the difficult questions of the time, and to his successors he bequeathed a weakened and divided empire and the necessity of a disastrous war.

Battle of Fontenay. — Just before his death Louis the Pious had sent Lothair the imperial crown. Lothair took this to mean that he had authority over his brothers, who, seeing their common danger, combined to oppose him. The allied army of Louis the German and Charles the Bald met Lothair's forces in the battle of Fon'tenay in 841. The result was the complete defeat of Lothair and the formation of a treaty which recognized the younger brothers in the independent possession of their lands.

Treaty of Verdun. — This was the famous Treaty of Verdun'

(843). By it Lothair retained Italy and a strip of territory extending between the lands of his brothers from the Alps to the North Sea. To the east of this strip was the dominion of Louis the German, a territory inhabited by purely German peoples. To the west of it was the share of Charles the Bald, almost wholly within the limits of modern France. So the Treaty of Verdun is of the greatest historical importance; for in the respective shares of Louis the German and Charles the Bald we see the beginnings of the two great modern nations, Germany and France.

In the part over which Charles the Bald ruled there was a strong Gallic and Roman element in the population, and the language spoken there was already beginning to resemble the modern French, while in Louis the German's territory the people spoke only German. In Lothair's strip of land between these two divisions there was a mixed population. Part of this territory seemed naturally to belong to the Western kingdom, and part of it to the Eastern. So, as we shall see, these lands became in after years a bone of contention between the rulers of France and Germany. For these reasons it is sometimes said that all the later history of western Europe is "but an exposition of the Treaty of Verdun."

Lothair's Share. — The "empire" of Lothair appears very insignificant in comparison with the vast dominions of his grandfather Charlemagne. The part north of Italy included the land between the Rhone and Scheldt on the west and Rhine on the east, together with the country known as Frisia, at the mouth of the Rhine. To keep this long, narrow region, with its indefensible frontier and ill-assorted peoples, under a single government was an impossible task, and Lothair divided it among his three sons, giving to one of them the title of emperor, just as Louis the Pious had done before him.

It is evident that this dividing and subdividing would soon leave very little of the original empire. One of Lothair's sons, Lothair II., obtained all the part north of Italy except Burgundy and Provence. This was known as *Lotharii Regnum*

(Lothair's kingdom), a term which was afterwards corrupted into Lotharin'gia, whence the modern name Lorraine' (German Loth'ringen), still applied to a portion of the lands once ruled by Lothair II.

But even this comparatively small tract of land could not be held together, for on Lothair II.'s death his uncles seized and, in 870, divided it between them, Louis the German taking the eastern portion. Hence arose the claim of Germany to the

lands between the Moselle and the Rhine, and the age-long dispute between France and Germany over the Alsace-Lorraine question. The lands which Louis the German obtained in 870 were, after the changes of a thousand years, again annexed to Germany after the Franco-German war of 1870-71, and restored to France after the World War of 1914-18.

The Carolingians in Germany.—Louis the German managed, by dint of hard fighting, to keep his dominions together and transmit them to his three sons. Two of these sons died, and the survivor, Charles the Fat, inherited the whole land. For a short time it seemed as if the empire of Charlemagne had been restored, for Charles, who had been crowned emperor by

the pope (882), also obtained the throne of the Western Franks, but he was weak in body and in mind, and quite unequal to the task of government. He let the Northmen plunder France, and on one occasion, having started to rescue Paris from their attacks; he was afraid to risk a battle, and made the disgraceful promise that they should have Burgundy to plunder if they would let Paris alone. The nobles soon tired of him, and were glad enough when a new claimant for the throne put in an appearance.

The End of the Dynasty in Germany. — This new claimant was Arnulf of Bavaria. He was a man of energy and strong will, and having caused the deposition of his uncle, Charles the Fat (887), he determined to make himself a real emperor. In 896 he was crowned at Rome, and even before that his supremacy had been acknowledged in France and Germany. But it was too late to piece together the fragments of the empire. Italy and France were under separate and independent rulers, and he had all he could do to hold his own in Germany against the growing power of the dukes and to protect his eastern frontiers against the Slavs. With Arnulf's successor, Louis the Child, the Carolingian line in Germany came to an end (911).

State of Germany. — During all this time the royal or imperial power in Germany had been steadily decreasing, while the duchies had been gradually gaining strength. These duchies were four in number, — Franconia, Saxony, Suabia, Bavaria, — and there were, besides, several marches, or border countries, which, like the duchies, tended to make themselves independent of royal control. So Germany became the scene of endless conflict between the kings and the dukes or counts.

The Carolingians in France. — Much the same state of things existed in France. Charles the Bald and his successors were too weak to repulse the attacks of the Northmen, and permitted them to burn and plunder some of their fairest cities. When the Northmen besieged Paris in 885, it was not the Carolingian king, but one of his feudal subjects, Count

Odo of Paris, who saved the city. After the deposition of Charles the Fat, Odo gained the throne as a reward; but on his death the Carolingians returned to power, Odo naming as his successor Charles the Simple, who allowed the Northmen under Rollo to settle in the north of France, in the province thenceforth known as Normandy (911).

End of the Dynasty in France. — Already two little separate kingdoms, Burgundy and Provence', had set themselves up within the limits of what is now France, and under Charles the Simple and his successors, the great lords usurped more and more of the royal power until they became nearly, if not quite, as strong as the French king himself. Finally, when the last Carolingian in the direct line had died (987), the dukes and counts decided to elect one of their own number as king, and they chose Hugh Capet, the descendant of that Odo who had fought the Northmen at Paris. Thus ended the Carolingian line in France. The new dynasty, called Cape'tian from the name of its founder, ruled the country for nearly three centuries and a half (987-1328).

Character of the Period. — This is one of the darkest periods in European history. It was a time of lawlessness and misrule, when there was no authority strong enough to repress violence and prevent private war. Men found that their rulers could not protect them against wrong. So they took the law into their own hands and redressed their wrongs themselves. The strong oppressed the weak, and society was distracted by continual feuds and outrages. Just as the empire of Charlemagne came to be divided into kingdoms, so these kingdoms split up into smaller fragments, and both in France and Germany the kings became more and more insignificant, till in point of power they were hardly to be distinguished from their great vassals. They could not reach the people except through the local rulers, and these local rulers often had no regard for the royal will. As a result, France and Germany became, not nations in the modern sense of the word, but loosely joined collections of little states, — duchies, counties, principalities, — owning slight obedience to the central authority.

Italy, too, was divided among many masters. The popes were trying to extend their power over the whole peninsula, and the German emperors were trying to force the country into the empire; but neither popes nor emperors were able to check the general tendency toward anarchy and subdivision. This division of power between the king and his lords, and between the lords and his vassals, is the chief characteristic of what we call the Feudal System, which by the close of this period of the later Carolingians had established itself firmly in Europe.

Growing Power of the Popes. — Yet in this breakdown of royal and imperial power the popes found an opportunity to extend their authority. They caused themselves to be regarded as the spiritual heads of Europe, and even in political matters they steadily gained ground. No coronation of an emperor was valid unless performed by the pope, and by threat of spiritual punishment he was often able to bring princes to submission.

CHAPTER XXXIII

THE NORTHMEN

Who were the Northmen? — Early in the ninth century, while Charlemagne was still ruling, a strange race of pirates made their appearance on the coasts of what is now France. Their long, sharp-pointed boats sailed up the French rivers and put into shore just long enough to enable their crews to attack some unsuspecting village, kill the inhabitants, and reëmbark with the booty. They vanished as mysteriously as they came, and it seemed impossible either to guard against the attacks or to punish the invaders. Charlemagne appreciated the danger and tried to protect his frontier, but without permanent effect. The attacks continued, and after his death became more frequent,

till finally they resulted in the conquest and occupation of some of the best lands of his successors.

These new invaders are known by the name of Northmen, from the fact that they came from Scandinavia and Denmark, the two northern peninsulas of western Europe. They were of pure German blood and knew nothing of Christianity or of the civilization of Rome; so their migration in the ninth and tenth centuries was a new German invasion like that which we

A VIKING SHIP

have described in treating of the period between 378 and 568. Those who staid at home built up the states which we know to-day as Denmark, Norway, and Sweden. The others settled in France, England, Russia, and Iceland, in each case adding a most important element to the population and shaping the subsequent history of those countries. They also made inroads into Spain, and settled in Sicily, Italy, Ireland, Scotland, and many of the smaller islands off the British coast, but in these regions they left few permanent traces. They were a rude,

vigorous race, delighting in war and adventure, and worshipping gods of the same savage and bloodthirsty character as themselves. They were skillful seamen and were called *Vikings*, from the vicks, or bays, with which the Scandinavian coast abounds.

I. THE NORTHMEN IN FRANCE

Inroads of the Northmen. — Since even Charlemagne could not defend his borders against these robbers, not much was to be expected of his weak successors. Early in the reign of Charles the Bald, who ruled over France on the division of the empire, the Northmen sailed up the Seine, burned the beautiful city of Rouen, and escaped unpunished. They soon came back and not only pillaged and murdered, but even exacted a tribute as the price of peace. This was several times repeated, the region north of the Seine and around Paris suffering the most.

As the king could not defend them, the inhabitants of that territory had to look out for themselves, and Robert the Strong became their champion against the invaders. The latter killed him in battle, but his son, Count Odo of Paris, took his place as the chieftain of the Franks, and when the Northmen laid siege to Paris in 885, he beat them back and saved the city. By this act he won for his family a respect which was not felt for the Carolingians, and laid the foundation of royal power; for the descendants of this Odo were the Capetian kings who succeeded the Carolingians on the throne of France.

Settlement of Normandy. — But the Northmen kept up their attacks, and finally their chief Rollo, or Rolf, secured from the French king, Charles the Simple, a grant of the land which was afterwards called Normandy. This was the Treaty of St. Clair-sur-Epte (911). By it Rollo agreed to do homage to the king and become the 'king's man,' in return for the lands which he had received. In other words, Rollo became Duke of the Northmen (now called Normans), and ruled over northern France as the feudal subject of the French king. But though

nominally subjects, the Norman dukes, successors of Rollo, became almost as powerful as the king himself, and their duchy of Normandy was one of the richest and strongest provinces of France.

The invaders quickly adopted the language and customs of their new country, but they did not lose their natural vigor or warlike habits, and a century and a half after they had settled in France, we shall find a descendant of Rollo winning for himself the crown of England.

II. ENGLAND AND THE NORTHMEN

The Anglo-Saxon Kingdom. — The invasion of the island of Britain by the Angles, Saxons, and Jutes, in 449, has already been mentioned. We have noticed, too, that the war between these German invaders and the Roman-Celtic natives was a war of extermination, and resulted in crowding the latter into the western part of the island. It took the Germans a century and a half to accomplish this result.

When it was done, there followed a long period of warfare among the conquerors. First one and then another of the petty states into which England was divided would win for itself a sort of leadership over the rest, but there was no central government or real unity. The details of the endless rivalries and wars between these half-barbarous peoples have not much interest for us. They have been compared to the "battles of kites and crows." This time is called the period of the Heptarchy (seven kingdoms, rule of seven) because during a part of the period there were seven of these little states.

Synod of Whitby. — Yet there were certain influences that tended toward unity. In the first place, ever since the conversion of Kent by Augustine, in 596, the country had been under one ecclesiastical government, that of which the pope at Rome was the head. At one time it had looked as if the island might be divided in religion as well as in government; for the Celtic Church, which differed in several respects from the Roman,

had a strong hold in the north. Oswy, the king of the powerful state of Northumbria, hesitated between the two forms of faith, but the matter was decided at the Synod of Whitby in 664. There Oswy, on hearing that Christ had given the keys of heaven to Peter, and that the popes were Peter's successors, declared himself on the side of the Roman Catholic Church, lest when he came "to the gates of heaven, there should be none to open them." Unity in religious belief and in church government led to unity in political affairs.

Attacks of the Northmen. — Another thing which tended to bring about the same result was the consciousness of common interests in the presence of a common enemy. This enemy was the Northman, who paid his first visit to the English coast in the year 787. From that time on, the ravages of the Northmen, or Danes, as they are called in English history, became frequent, and the Anglo-Saxons began to feel the need of combined action under a single leader in their own defense. Egbert, king of Wessex, was the first king of all England (827), and from this time the history of the English monarchy really begins. He was a strong ruler, and was followed by worthy successors who did good service against the Danes. But the attacks of the latter continued with increasing success until, at the beginning of the reign of Alfred, Egbert's grandson (871), they had all England north of the Thames.

Alfred the Great and the Danes. — Alfred inherited a war rather than a kingdom; for the Danes attempted to seize even the country south of the Thames, so that he had to fight if he would retain a single foot of land to rule over. The manner in which he faced his enemies and finally triumphed over them, and the fine qualities he displayed as a ruler, have rightly earned for him the title of the Great.

At first he had to buy off the Danes, for he had not force enough in his little kingdom to resist them. Nor was he a match for them when they came back with larger numbers and renewed the war a few years later. He was defeated and hunted like a runaway slave in his own country. On this

occasion, according to the well-known story, he escaped in disguise, and found shelter in a peasant's hut, where the housewife set him to watching her cakes and scolded him when he absent-mindedly let them burn. But he raised a new army, and this time was successful. By the Treaty of Wedmore in 878, the Danes acknowledged his right to the western half of England and all the land south of the Thames. The eastern half north of the Thames remained with the Danes, and was called the *Da'nelagh* (*Danelaw*). Twice afterwards he came into conflict with these people, but on each occasion he was successful and toward the end of his reign his supremacy was acknowledged over almost all England.

Character and Work of Alfred the Great. — It was as hard a task to restore order and prosperity to his kingdom as it had been to wrest it from the Danes; for war had devastated the fields, ruined the towns, and demoralized the people. Alfred's work of restoration was as wise as it was unwearied. He collected and revised the old laws, administering them with strictness, but with justice. The general lawlessness gave place to a wholesome respect for the king's peace, and it was said that a man could travel from one end of his dominions to the other without danger to his life or property.

His best work was the education of his people. Seeing their need of books in their own language, he himself learned Latin and translated several important works into Anglo-Saxon; so that he may be said to have really founded the native literature. He began the *Anglo-Saxon Chronicle*, one of the most valuable authorities on the history of the period, and he wrote the record of his own reign. In all this he had but one motive, — the welfare of his people, and he seems on this account to stand almost alone among the great rulers of the world; for he regarded his office as a trust and himself as the servant of his people. He was England's best and greatest king.

The Danish Conquest of England. — Alfred died in 901. His successors governed well, and the Danish inhabitants gradually settled down to peaceful occupations and mingled with the

natives. Under Edgar (959-975) the power of the kingdom reached its height. All Britain acknowledged the sway of this ruler, and, according to the story, the royal barge was rowed by eight vassal kings.

But in 991 the Danes renewed their attacks, this time on a larger scale, and King Olaf of Norway and Swegen or Sweyn of Denmark each headed expeditions. Eth'elred the Redeless (without counsel), the English king, was an incapable prince, and being unable to meet the Danes in fair fight, resorted to the cruel and cowardly plan of a general massacre of the Danish settlers (1002), killing the sister of King Swegen among the rest. Swegen retaliated by overrunning and plundering the country, and finally in 1013 made himself king of England in place of Ethelred, who was forced to flee to Normandy. Swegen died soon afterward, but the fight went on between his son, Cnut, or Canute, and Ethelred. Ethelred died in 1016, and his son, Edmund Ironsides, a braver and better ruler than his father, succeeded in keeping half of the kingdom, but he died a few months later, and left Canute master of all England.

The Reign of Canute. — Canute ruled from 1016 to 1035. His empire covered a wider territory than any other state in Europe at that time, for it included Denmark, Sweden, Norway, and England. Though a foreigner, he ruled England wisely and well, dealing impartially with Danes and Englishmen, and doing his best to make them one people. In this he was successful; for the Danes were of the same blood as the natives, and quickly fell into their ways and learned their language.

Instead of governing like a conqueror, Canute seems actually to have loved England better than his native Denmark. He was a Christian, and ashamed of the cruelties of his heathen ancestors toward the English, as well as of his own doings when he was fighting for the English crown. He ruled as if he wished to make atonement. He was simple in his tastes, and cared little for royal show. There is a familiar story of his rebuking the flattery of his courtiers. He asked them if they

thought the waves of the sea would stand still at his command, and when they said they were sure of it, he tried the experiment in a very solemn manner in their presence. When it was clear that the waves paid no attention to the royal command, he gave the flatterers a wholesome little lecture on the feebleness of earthly kings as compared with the power of Heaven.

Unfortunately for the English, his sons were men of a very different stamp. Harold (1035–40) and Hardicanute (1040–42) were bad rulers and roused the hatred of the English. The old Anglo-Saxon line was restored by the accession of Edward the Confessor, who ruled till within a few months of the Norman conquest (1042–66).

III. OTHER SETTLEMENTS BY THE NORTHMEN

The Northmen in Russia. — While bands of Northmen were plundering the coasts of England and France, others were invading Russia. At first they held the lands just east of the Baltic, but gradually they advanced into the interior. In 862 their chief, Ruric, established a kingdom with its capital at Novgorod. This was the beginning of the Russian Empire, for Ruric's successors in the direct line ruled for over 700 years. Thus the ruling people in Russia were of the German race, but these German Northmen were quick in adapting themselves to the manners and language of the Slavs and Finns of Russia, just as they were quickly transformed into Englishmen in England, and into Frenchmen in France. Many of the later comers from Scandinavia passed down the rivers of Russia and settled in Constantinople, where they became the bodyguard of the Eastern emperors, and served in their wars. These Varangians, as they were called, were very brave and faithful defenders of the rulers at Constantinople.

Norse Settlements in Iceland and the British Isles. — Sea rovers from Scandinavia settled in Iceland as early as 874. There they established a little Norse state, shut off by its remote

situation from European rivalries and wars, and preserving uncorrupted the original traditions of the race. The mediaeval literature of Iceland, especially the collections known as the Eddas, are the best sources we have for knowledge of the customs and character of the early Northmen.

Norse tribes settled also in the Orkney Islands, the Heb'rides, and on the coast of Scotland and Ireland; and they penetrated as far west as Greenland and America. In America it is doubtful whether they made any settlement, but it is known that they visited the country early in the eleventh century, and the Vinland of which their writers speak has been identified with a part of New England.

Such, in brief, is the story of the migrations of the Northmen. It does not include their wanderings after they had become thoroughly nationalized in the countries in which they settled. We shall see that those who settled in France and had become to all appearances Frenchmen nevertheless kept their old adventure-loving spirit, and made more conquests. We shall encounter again these French Northmen or Normans when we come to trace the history of England and of Italy.

CHAPTER XXXIV

RISE OF THE MOHAMMEDAN POWER

The Mohammedan Movement. — So far we have concerned ourselves chiefly with Christian nations or with races that eventually became Christian. We come now to the history of a new religious movement, that of Mohammedanism or Islam (meaning submission) which disputed with Christianity the possession of the West, and at one time seemed on the point of mastering the whole of Europe. Like Christianity, it originated with a Semitic people, the Arabs, kinsmen of the Jews, but it differed from Christianity in the rapidity with which it spread. Founded by Mohammed early in the seventh century, it forced itself upon the peoples of central and western Asia and northern Africa before a hundred years had passed. In one century it acquired a far wider territory than Christianity had gained for itself in seven, and to-day its adherents number over a hundred millions.

The Arabs. — The Arabs are a branch of the Semitic race. Their original home, Arabia, is a table-land, barren for the most part, but with fertile regions here and there of considerable extent. Before the time of Mohammed the Arabs were a semicivilized people without either a settled government or a fixed abode. Their religion was a mixture of superstitions, many of their religious notions being borrowed from other races with whom they came in contact; for the great caravan route between Egypt and the East lay through Arabia, bringing

numbers of foreign merchants into the country every year. The worship of the stars was observed among them, and they believed in genii, giants, and various kinds of demons.

Their chief city was Mecca, famous as the seat of a temple called the Ka'aba, containing a holy stone which they thought had been sent from heaven by the angel Gabriel, and had originally been pure white, but had become blackened by tears shed by pilgrims for their sins. The guardianship of this sacred object was intrusted to a particular family called Ko'reish, who were thus the high priests of the Arab religion.

Mohammed ; his Early Life. — Mohammed was a member of this family of the Koreish, the strongest and most orthodox upholders of the religion that he was destined to overthrow. He was born about 570, and, being left without support by the death of both his parents, was brought up by his uncle. The latter, however, was very poor and Mohammed had to work for his living at any humble occupation that offered itself, even such as was thought to be fit only for slaves. At last he was employed as camel driver by a rich widow named Kadi'jah, who after some years married him, thus raising him at once to a position of some importance.

Early in his life he had shown himself very susceptible to religious impressions and he used often to retire to lonely places to pray. He seems to have had trances, — possibly of an epileptic origin, — in the course of which he thought he heard voices and saw visions. At first he thought that these were sent by evil spirits, but at last he came to believe that they were messages from God, calling him to testify to the truth of religion. In other words, he thought he was a prophet, whose mission it was to call men back to belief in God. At first he did not think that he was the apostle of a new faith, but merely that he was a prophet of the old. Later, however, he believed that he had received a special revelation and that he had learned new truths. He wrote down on bits of bone or stones the words of the being that appeared to him in his dreams, whom he took to be the angel Gabriel, and these scattered writings,

afterwards gathered together, formed the Koran', the Bible of the Mohammedans.

The Hegira (622 A.D.). — It was hard to convince others of his divine mission, and conversion was a slow process. Only his wife and some of his relatives believed him at first. In three years he made but forty converts, and these were so persecuted and harassed by the orthodox people of Mecca, that it seemed as if the new faith must be crushed out. But Mohammed was very persistent and very sincere, and the faith he preached was better and purer than the old. His followers gradually increased till they formed quite a numerous body, but the feeling against them was so strong on account of Mohammed's attacks on the idols of the old religion that many ran away to the city of Medi'na, where the people were more tolerant. Finally Mohammed himself was driven out and took refuge in the same city in 622. This was the famous Heg'ira or Flight from Mecca to Medina, an event considered so important by the Mohammedans that they reckon their time from it just as Christians reckon theirs from the birth of Christ.

Mohammed as a Conqueror. — After reaching Medina, where he was kindly received, Mohammed began to spread his religion by the sword. It is said that his character entirely changed and that from being a peaceful prophet, he now became a merciless conqueror, saying, "The sword is the key of heaven and hell." The truth is, while he no longer relied on the slow method of peaceful conversion, he was more lenient in dealing with his enemies than one would expect from an Arab chief of that day. The Koran, tribute, or the sword was the choice offered them, and, in the case of Jews and Christians, tribute was readily accepted.

His first victory was at Badr or Bedr, where he defeated his old enemies, the people of Mecca, in 624. It was an insignificant battle in respect to the numbers engaged, but important from the fact that the odds were so much against Mohammed that his victory seemed miraculous and many were led to believe in him as the true prophet. A few years later he captured

Mecca, and in the meanwhile his expeditions against the tribes in the interior had been almost invariably successful. In the ten years between the Hegira in 622 and his death in 632 he had made almost all the tribes of Arabia accept his new religion, and had even written a letter to the Eastern emperor demanding that he, too, should become a convert.

Mohammedanism.—The essence of Mohammed's faith is contained in the words, "There is but one God, Allah, and Mohammed is his prophet." He believed that God's word had been revealed to others besides himself,—that Abraham, Moses, Christ, each had a divine mission,—but Mohammed was the last and greatest prophet. The Koran clearly shows the influence of the Bible, as we should naturally expect from the association of the Arabs with the Jews and Christians, but it lays great stress on certain virtues and observances. The duties of the Mohammedans are almsgiving, pilgrimages to Mecca, reciting three prayers daily, and fasting during the holy month of Ramadan'. Mohammed forbade them to drink wine or eat pork. They believed in a Paradise where everything was to be found that could gratify the senses, but the way to it was across the bridge of Al Sirat, which was as narrow as a dagger's edge. Only the souls of the blest could cross the bridge. The others fell off and were lost forever.

They believed that Allah, God, had determined all things beforehand, and ordained who should be saved and who should

INTERIOR OF A MOSQUE

be eternally punished. They expressed this idea by saying that Allah took two handfuls of earth, and threw one in one direction, saying, "These to heaven, and I care not," and another in another direction, saying, "These to hell, and I care not." A man could not, by his own act, lengthen or shorten his life by a single minute. Believing this, a Mohammedan could rush into battle with perfect fearlessness, for the term of his life was fixed by Allah. This accounts, in some measure, for the desperate bravery shown by the Moslems (*i.e.* believers) in their wars of conquest.

Early Conquests.—The first caliph, or successor of the prophet, was Abu-bekr, the father-in-law of Mohammed; but there was a considerable party who were disappointed because Mohammed's son-in-law, Ali, was not chosen. This disagreement led to a division, which has continued to our own time, between those who believed in Ali's claim and those who opposed it; the former, called Shi'ahs, or Shi'ites, being represented by the Persians to-day, while the Turks are Sun'nites, that is, opponents of Ali.

Abu-bekr completed the conquest of Arabia, and then sent armies into Syria, Palestine, Mesopotamia, and the Persian Empire. Under his two successors, Omar and Othman, these conquests were made complete, and the new faith was carried eastward into central Asia, and westward into Egypt and along the northern coast of Africa. In less than forty years from the death of the prophet, his successors ruled the land from India in the east to Trip'oli in northern Africa in the west. They had destroyed the Persian Empire and robbed the Roman emperor in the East of some of his richest provinces. To Christians and Jews they gave the choice of tribute or the Koran. All others were forced on pain of death to accept the Koran.

Both Omar and Othman were assassinated, and the supporters of Ali at last succeeded in raising him to the throne, but his reign was short and troubled. Rival claimants set themselves up, and finally Ali was assassinated. Thus ended the line of 'orthodox' caliphs, so called because they had all

been related to or in some way associated with Mohammed. The rule now passed to the family of the Ommi'ads.

The Peril of Europe. — The Ommiads made Damascus their capital, and ruled from 661 to 750. Under this dynasty the Mohammedan power threatened to overthrow Christendom. Europe was attacked from two quarters at once—from the east and from the west.

In the east the Moslems tried to seize Constantinople, but after several desperate onslaughts between 668 and 675, and a renewed attack in 717, they gave up the attempt. In repelling their assailants, the inhabitants made use of Greek fire, an inflammable compound which ignited anything that it struck.

In the west they first conquered northern Africa to the Atlantic Ocean. Only the narrow Straits of Gibraltar now separated them from Spain, which, as we have seen, had been the seat of a Visigothic kingdom since 415. A traitor in the service of Roderick, the last of the Visigothic kings, is said to have aided them in entering Spain. At all events, they landed without opposition and advanced into the interior, till at Jerez (hā'reth) de la Fronte'ra they found their way blocked by Roderick and his men. The battle of Jerez (711) decided the fate of Spain. The country was now in the hands of the Saracens.

The next thing was to win the lands of the Franks. Crossing the Pyrenees, they soon had southern France in their power. How Charles Martel came to the rescue of Europe and won the decisive battle of Tours (732) has already been told. Thenceforth they held but little land north of the Pyrenees. Their plan had been to conquer the entire world. A glance at the map will show that their empire curved like their own emblem, the crescent, with one point near Constantinople, and the other at the Pyrenees. But for the repulse at Constantinople and the defeat at Tours, the two points might have been made to meet in the heart of Europe, and all Christendom might have been brought under the Mohammedan power.

Division of the Mohammedan Empire. — The Ommiads were

overthrown in 750 and a new family, the Abbas'sids, came into power. One of the Omniads, named Abderrah'man, escaped to Spain, where his rule was acknowledged. The Abbassids moved the capital to Bagdad, but by transferring the seat of their power to the East, they gradually lost control of the western part of their dominions. The Saracens, or Moors, in Spain became independent, and in 909 another independent Mohammedan power was founded in northern Africa by the Fatimites or descendants of Fatima, the daughter of Mohammed. Thus at the close of the tenth century, there were three great divisions of the Mohammedan Empire: first, the Abbasid Caliphate, with its capital at Bagdad; second, the Spanish Caliphate, with its capital at Cor'dova; and third, the Fatimite Caliphate, with its capital at Cairo.

The Moors in Spain. — The term 'Moors' is applied to those

MOORISH GATE, TOLEDO

Arab tribes that settled in northern Africa and Spain. They held Spain for over 750 years, but they never got possession of the entire country. Fragments of the Visigothic kingdoms still remained, and these little Christian kingdoms in the north were destined to grow into a power strong enough to master the whole peninsula. But all through the Middle Ages Spain was the seat of a Mohammedan civilization

In most respects it was a higher civilization than

that of the neighboring Christian states, for the Arabs were great students of philosophy and science, and in the arts,

especially in the art of building, they led all Europe. In the tenth century their power reached its height, but in the eleventh century, after fresh invasions by more barbarous tribes from Africa, it gradually declined. It was not till the reign of Ferdinand and Isabella, however, that the last vestige of the Moorish power was destroyed (1492).

The Caliphate of Bagdad. — Although they lost control over the West, the Abbassid caliphs possessed great power. Bagdad became for a time the most splendid city of the world. The 'golden age' of the Caliphate was the early part of the ninth century. This was the time of the great Haroun'al-Rasch'id, who is mentioned in the *Arabian Nights*. Many stories are told of his vast wealth and the magnificence of his court.

But not long after his death, the Caliphate began to split up into nearly independent states, and at the same time the Turks began to invade its provinces. The caliphs hired the Turks to defend them, establishing a standing army which, like the Praetorian Guard of the Roman Empire, became the real power in the state. In 1058 the caliph gave his authority to the Turkish conqueror, Togrul Beg, and thenceforth the caliph was merely a religious officer, while all political power was in the hands of the Turkish sultan.

Conclusion. — Such were the principal events in the early period of the Moslem power. Spain was lost to Christendom, but Europe was spared. The Eastern Empire was still standing, but Africa, Egypt, and its eastern provinces were in the hands of the Moslems. The danger of Mohammedan conquest was averted, and did not reappear till the fifteenth century. We shall then find that the Mohammedan aggressors were no longer the Semitic Arabs, but a Turanian people whom the Arabs had converted. It was the Turks that finally captured Constantinople in 1453 and again threatened Christian Europe with Mohammedan conquest. In the meanwhile, however, Christian Europe had been the aggressor in the series of wars known as the Crusades.

 CHAPTER XXXV

THE CRUSADES

Nature and Causes of the Crusades. — The crusades were the attempts of the Christian nations to rescue the Holy Land from the Mohammedans or "infidels." They fall within a period of two centuries, the first beginning in 1096, and the last coming to an end in 1270. The first and immediate cause of these expeditions was the occupation of the Holy Land by the Seljuks', a Turkish tribe from Western Asia, who, in 1058, had overrun Syria and Asia Minor, making Nicaea their capital. Syria had previously been held by the Arabs; for, as we have seen, it was one of the earliest conquests of the Mohamme-

dans. Under Arab rule, however, the Christians were generally treated with some toleration.

Treatment of Pilgrims. — It had long been the practice of pious Christians to make pilgrimages to the holy places, the scenes of the Saviour's life and sufferings, and about the beginning of the eleventh century the number of the pilgrims greatly increased. They were subjected to many restrictions, and regarded with contempt by the Arabs, but they were not as a rule ill used.

The Seljuk conquerors of Syria, however, adopted a different policy. They, too, were Mohammedans, but they were far more savage and intolerant than the Arabs. They treated the pilgrims with cruelty, and outraged Christendom by their desecration of the holy places.

The Religious Sentiment. — The eleventh century was a period of deep religious feeling; the power of the Church was on the

increase, and the papal chair was successively occupied by able and sincere men, bent on strengthening the influence of the Holy See. It was represented that God and his saints were offended by these insults to the true faith; and the tales of wrong and cruelty brought back by the pilgrims added motives of hatred and revenge to the natural desire of the Christians to save Palestine from the enemies of Christ.

Such, in the first instance, were the causes of the crusades. The main impulse was religious zeal, and selfish and worldly motives did not at first control them; but in the course of time the movements lost much of their original character. Greed, policy, and the desire for adventure deprived them of the appearance of holy wars.

The Beginning of the First Crusade. — The emperor of the East, Alex'ius I., found his empire threatened by the Turks, and applied to Pope Gregory VII. for aid. None came, because the pope was then in the midst of his struggle with the German emperor; but under Pope Urban II. the matter was revived. This pope was the real author of the first crusade. He did not advocate it on the ground that the Eastern Empire was in danger, for the people of western Europe cared nothing for the Eastern emperor; but he appealed directly to the religious sentiment of the people and brought to bear on them the full weight of the authority of the Church.

Council of Clermont. — He assembled in France the famous Council of Clermont, in 1095, and there, in the presence of an immense throng, made a powerful plea for the undertaking of a holy war. He declared that the cause was the cause of God himself, who would not allow labor on his behalf without due reward. The man who perished in this pious service was sure of Paradise. If he lived, he would march to victory and reap a rich reward in the plunder of his enemies. Moreover, it was believed that service against the enemies of Christ washed away the stains of guilt. When he finished, the multitude shouted, "It is the will of God!" The cross was chosen as the badge of the movement, which from this circumstance received the name of Crusade.

Peter the Hermit. — The efforts of Urban II. were aided by an eloquent and earnest monk, known as Peter the Hermit. After the Council of Clermont he traveled through Italy and France, drawing crowds to hear him whenever he spoke. He pictured the sufferings of the Christians and the insolence of the Turks, appealing now to the pity, and now to the passions

of the listeners. The excitement was intense. Thousands took the cross and stood ready to follow him to the Holy Land.

The Crusaders. — There were two classes of the crusaders. First there were those who were carried away by mere blind fanaticism, and believed that they would gain their ends by the favor of God, without regard to the nature of the means employed. They gathered in ill-disciplined and unorganized bands, around any leader who happened to take their fancy, and started pellmell for the Holy Land, without adequate supplies or effective guidance. The largest body of this sort was the rabble that followed Peter the Hermit, who, whatever his abilities as a preacher, was quite unfit for military leadership. Another motley crowd joined the standard of Walter the Penniless, a knight with more pretensions to military skill than Peter, but utterly unable to control his disorderly followers. Similar bands were got together by other leaders.

The other class of the crusaders consisted of the chivalrous armies of France and Italy, led by prominent feudal lords, such as Godfrey de Bouillon, Duke of Lorraine, Robert of Normandy, son of William I. of England, and Raymond of Toulouse', from France, and Boemund of Otranto and his cousin Tancred, from Italy. Though a volunteer force and lacking the efficiency of a modern army, it was better disciplined and better led than the loose masses just described. It should be noted, however, that the troops were merely personal followers of their chiefs. No king took part in the first crusade, and there was nothing to hold the different bodies together except their enthusiasm in a common cause.

The Fate of the Vanguard. — The band led by Walter the Penniless grew tired of waiting for the others and started first, passing through Hungary and Bulgaria and reaching Constantinople in the summer of 1096. Their lawlessness on the way provoked the natives of the countries through which they passed, and many of the band were slain. Peter the Hermit's band soon followed and passed through the same experience, losing an even larger number on the way.

Reaching Constantinople, the two forces joined, and being permitted by Alexius to cross into Asia Minor advanced to the vicinity of Nicaea, where they paused, not daring to go on till reinforcements came. But it was impossible to keep them in order. They scattered throughout the plains in search of food, paying no attention to the commands of their leaders. At last they were attacked by the Seljuks and cut to pieces.

The Main Body. — The divisions of the main army passed over to Asia Minor by three different routes. The number of the whole force is said to have been 700,000, but this is doubtless exaggerated. When they reached Constantinople, they had trouble with the emperor Alexius, who, while he hated the Turks, had no desire to see Syria fall into the hands of the crusaders. Syria had formerly been a province of the Eastern Empire, and it was the ambition of Alexius to regain it. He was perfectly willing that the crusaders should do the fighting, but their conquests, he held, should belong to him. Accordingly he required the Christian princes to take an oath acknowledging themselves to be his vassals. Godfrey de Bouillon refused to do this, but the emperor attacked the crusaders and finally Godfrey consented.

Capture of Nicaea. — The first important action of the crusaders was the siege of the Turkish capital, Nicaea. They had reached that city in May, 1097. The Turks, having defeated the first band of crusaders so easily, thought there was no need of hastening to its assistance. The siege was conducted in an irregular manner, each division of the attacking force carrying out its plans in its own way. Nevertheless the crusaders were successful and the inhabitants were on the point of surrendering, when the emperor Alexius, by a secret arrangement with them, was admitted with his troops within the walls. The city surrendered to him instead of the crusaders, who were thus cheated of their spoils.

Siege of Antioch. — Another important siege was that of Antioch. This city was the key to all Syria, and its capture was a work of great difficulty. It finally fell into the hands of

the crusaders through the treachery of one of the garrison, but now it was harder to keep it than it had been to take it; for fresh Turkish forces arrived and the Christians were in turn besieged. They were outnumbered, and as fast as their assailants were killed off, reinforcements came to take their places.

At last the besieged put forth all their strength in a desperate sally. They were nerved to it by a supposed miracle — the finding of the lance which had pierced the side of the Saviour, which, it was said, would insure their victory. It was a pious fraud to rouse them to enthusiasm, but it succeeded. The Turks were scattered, and Antioch came into the possession of the Christians. This time they determined to keep it in their own right. They did not permit the emperor to gain it.

Capture of Jerusalem. — The crusaders now advanced on Jerusalem, which they found was defended by a strong force. Its capture was an easier matter than the taking of Antioch. The defenders were unable to hold out against the fierce attacks of the besiegers, and the city was soon in the hands of the Christians. The conquerors showed little of the spirit of Christianity in their moment of triumph. The Mohammedans were butchered without mercy. The capture of Jerusalem was the crowning success of the first crusade. The object for which the movement was undertaken was now gained.

The Kingdom of Jerusalem (1099). — The conquered lands were now formed into a little feudal kingdom, the head of which at first was Godfrey de Bouillon. He would not, however, accept the title of king, preferring to be called Defender of the Holy Sepulcher.

TOMB OF GODFREY DE BOUILLON

Battle of Ascalon. — But another great battle had to be fought before the crusaders were securely established in possession. The Mohammedans of Egypt, who were hostile to

Christians and Turks alike, had conquered part of Syria. In fact, it was they and no longer the Turks who held Jerusalem at the time of its capture. These new enemies, in numbers far stronger than the Christians, attacked the latter at As'calon, but the Christians put them to rout, capturing and plundering their camp. After this success many of the crusaders returned home.

Results of the First Crusade. — Of all the crusades this one was the most successful. The Holy Land had been rescued from the unbelievers and turned into a Christian state. In the West, the news was received with the utmost enthusiasm and people did not consider the sacrifice which the success had cost. It is impossible to estimate the loss of life among the crusaders. It is said that 300,000 perished in the ill-fated expeditions of Walter the Penniless, Peter the Hermit, and the other leaders of the vanguard; and of the main body only a small portion ever returned.

The success purchased at such a price was not destined to be lasting. The so-called Kingdom of Jerusalem had all the defects of the feudal states of Europe. It was without unity, and therefore without strength.

The Second Crusade (1147-49). — The cause of the second crusade was the loss of the Christian stronghold of Edessa — a loss which seemed to threaten the destruction of the Kingdom of Jerusalem itself. For some years after the first crusade the newly established kingdom had seemed to thrive. New colonies were planted, and it gained in extent and population. But the complicated and cumbersome feudal government was ill adapted to its surroundings. A strong centralized system, with one vigorous ruler at the head, was what was needed in the midst of a hostile country.

When Europe heard of the fall of Edessa, the alarm was great; for it seemed as if what had been gained with such enormous sacrifice would all be lost. The preacher of the second crusade was St. Bernard of Clairvaux, who, like Peter the Hermit, was a man of intense earnestness and

wonderful eloquence. Unlike Peter, however, he succeeded in winning over kings as well as common people. Louis VII., king of France, and Conrad III., emperor of Germany, were the leaders of the second crusade.

Military and Religious Orders.—Between the first and second crusades two peculiar military and religious orders were established. These were the Knights Hospitalers, or Knights of St. John, and the Knights Templars.

The Knights of St. John were organized originally to care for the sick and wounded among the crusaders and pilgrims to Jerusalem. They took the usual vows of monks, but to these were added vows of military service. They had thus a combined religious and military character, being fighting men as well as monks.

The Knights Templars were organized on a similar plan, but their original purpose had been to protect the pilgrims to the Holy Land.

At a later date there was another of these orders established under the name of the Teutonic Knights. All three played an important part in the crusades, and they continued to exist long after the crusades were over.

A KNIGHT TEMPLAR

Failure of the Second Crusade.—Both the French king and the German emperor had large and well-equipped armies, but each worked independently of the other. The Germans reached Constantinople first, and tried to obtain aid from the Eastern emperor Manuel. But he was anxious to be rid of them as soon as possible. He promised them aid and hurried them on; then he did all he could to put obstacles in their way. The whole German army was cut to pieces in Asia Minor, and only the emperor with a few followers escaped.

Louis' army came soon afterwards and had the same experience of Manuel's treachery. They succeeded in capturing some towns and penetrated further into the interior than the German army, but in the end they, too, were destroyed by the Turks. The king escaped and returned to France. The crusade had accomplished absolutely nothing.

Fall of Jerusalem. — Forty years followed before the Christians made another attempt to restore the failing power of the little kingdom. In this interval a new and powerful foe arose in the south. This was Sal'adin, the Mohammedan governor of Egypt, a man of unusual talent both in military affairs and diplomacy, who succeeded in extending his rule over the Mohammedan population of Syria. This brought him into contact with the Christians, and war soon followed. Saladin was successful, routing the Christian forces at Tiberias. Jerusalem now fell into his hands.

The Leaders. — There was no need of an eloquent monk to preach the duty of the third crusade. All Europe was bent on repairing the loss of Jerusalem; and it so happened that on the thrones of the principal kingdoms were men of energy and warlike tastes. The leaders of the third crusade were the three most powerful sovereigns in Europe; namely, Frederick Barbaros'sa of Germany, Philip Augustus of France, and Richard I. (the Lion-Hearted) of England.

Events of the Third Crusade (1189-92). — Here, again, the fatal weakness of the movement was the lack of coöperation among its leaders. The German force had almost the same experience as the army of Conrad in the previous expedition. It was deceived by the Greeks, lost its way in Asia Minor, and was cut down before reaching Syria. Frederick Barbarossa was drowned while trying to cross a swollen stream.

Siege of Acre. — The French and English forces, under their respective kings, reached the Holy Land and laid siege to the city of Acre. The city finally surrendered, but in the meanwhile the crusaders were divided by jealousies. Philip Augus-

tus and Richard were constantly quarreling, and finally Philip gave up the war in disgust and returned to France.

Close of the Third Crusade. — Richard and Saladin were now the chief contestants, and the war continued with varying success. Great valor was shown on both sides, and Richard especially won fame by his brave exploits. His deeds made him a hero of mediæval romance; but though brave, he was selfish, cruel, and unwise, and far inferior to Saladin in generosity. At last a truce was made, leaving Jerusalem in the hands of Saladin, who, however, granted to Christian pilgrims admittance to the holy places.

On his return home, Richard had to pass through Austria, whose duke he had offended by his rash and arrogant conduct during the crusade. He had also angered the German emperor Henry VI. His enemies took vengeance on him by throwing him into prison and refusing to deliver him except on payment of a ransom. The money was finally raised from Richard's English subjects, and he returned to England.

The Fourth Crusade (1202-1204). — The peculiar feature of the fourth crusade is that it was diverted wholly from its original purpose and became an expedition against a Christian power. By this time it had become clear that the safest way to reach Palestine was by sea. Accordingly, when a new crusading movement was set on foot in France, it was decided to hire the great maritime city of Venice to carry the army to its destination. Only the minor princes took part in this crusade, and the most famous of these were Bon'iface II., Marquis of Montferrat, and Baldwin IV., Count of Flanders.

When the Venetians were asked to transport the crusaders, they demanded an enormous price for the service. Not having the requisite money, the crusaders agreed to pay the Venetians by helping them against their enemies. The first service that the Venetians demanded was the capture of Zara, a city on the eastern coast of the Adriatic, and the headquarters of pirates. The crusaders now began to think that they would do the cause of Christ more service if, instead of going to the Holy Land, they attacked Constantinople. The

conduct of the Eastern emperors during the previous crusades seemed to call for vengeance, and there was tempting prospect of unlimited plunder if the expedition should succeed.

Capture of Constantinople. — The crusaders listened to the advice of the Venetians, and set sail for Constantinople. One of the things that had influenced them was the fact that there was a contest for the throne in the East or Greek empire at this time, and the unsuccessful claimant promised a rich reward to the crusaders if they would aid him in recovering his throne. The city was easily captured by the crusaders, but

CRUSADERS

the price that had been promised was not paid, and the war was renewed, with the result that Constantinople fell into the hands of the Western Christians.

Latin Empire. — The conquerors divided the spoils among them, and a new Latin kingdom was set up with Baldwin of Flanders at the head. Venice received a large part of what had been the Eastern Empire, her ruler taking as his official title Doge of Venice and Ruler of Three Eighths of the Roman Empire. Venice did not actually hold as large a share of the empire as this, but she profited from the conquest to a greater extent than the crusaders themselves; for it opened up

trade to her and gave her the control of the eastern end of the Mediterranean Sea. The new kingdom established on the ruins of the Eastern Empire was not destined to last long; for it was weakened by disunion and lacked sufficient money and means to establish itself firmly. It lasted until 1261, when the Greeks regained control.

The Children's Crusade. — One of the most singular instances of the blind faith which ruled men in the Middle Ages was the attempt to regain the Holy Land by armies of children. In 1212 a lad named Stephen of Cloyes preached a new crusade. In it only children were to take part, and thousands of boys and girls started for the Holy Land. One band reached Marseilles, whence they set sail in vessels provided by merchants, but were either lost by shipwreck or sold as slaves to the Mohammedans. Another party started from Germany, it is said, and after many hardships reached the Italian port of Brin'disi, but they were not allowed to take ship for the Holy Land and were sent back home. Some went to Rome, but the pope ordered them back to their homes.

Crusade of Frederick II. — Between 1217 and 1230 several attempts were made to recover the Holy Land, and on one occasion when the fortress of Damiet'ta was captured in Egypt, there seemed to be a chance of bargaining with the infidels for the holy places. But the fanaticism of the times prevented this rational course, and the war was continued with results unfavorable to the Christians. More important was the crusade of Frederick II., the German emperor, who, after putting

MOSQUE OF OMAR

off his journey for various reasons, set out for the Holy Land in 1228. Frederick was the first crusader to show common sense and foresight in dealing with the Turks. He thought it good policy to take advantage of divisions among the Mohammedans and gain his ends without fighting; and in this he succeeded, for in 1229 Jerusalem was surrendered to the Christians, the only reservation being that the Mosque of Omar should be kept by the Mohammedans. Frederick crowned himself king of Jerusalem and returned to Europe, having regained for the Christians not only Jerusalem and the holy places, but a considerable extent of territory.

Crusades of Louis IX. — In 1244 Jerusalem was again taken by the infidels, but four years later Christendom found a champion in Louis IX. of France, a man of great ability and intense religious feeling. The first of his crusades was directed against Egypt, where he captured the city of Damietta and made an expedition into the interior; but in the course of his retreat he and his entire army fell into the hands of the enemy, and he was set free only on the payment of an excessive ransom and the surrender of Damietta. He then went to Syria, and spent several years in an attempt to restore the power of the Christians, but failed in the end and returned to France in 1254. He made another effort to conquer the Holy Land in 1270. In this year he again tried to break the power of the Mohammedans by an attack on Egypt. Accordingly the city of Tunis was besieged, but the attempt failed and Louis died of the plague in the summer of 1270. An English prince, who afterwards came to the throne of England under the title of Edward I., went on and invaded Syria, but accomplished little.

The Christian power in the Holy Land was now failing, and after the capture of Acre in 1291, the Christians were driven out, and Syria passed permanently under the control of the Mohammedans. Thus all these great expeditions, with their enormous sacrifice of life and money, had failed in the object for which they were intended. Almost the only lands retained by the Christians in the East were the islands of Rhodes and

Cyprus, which were held for many years by the Knights of St. John.

The Effects of the Crusades. — The crusades came to an end partly on account of the exhaustion of Europe and partly on account of a change in the spirit of the times. The effects of the crusades were both good and evil.

Among the evil effects may be mentioned the fact that they stimulated the persecuting spirit; for if it was right to use force against infidels, it was natural to suppose that heretics also should be compelled by violence to accept the true faith.

Another effect of the crusades was the weakening of the feudal system; for they diminished the number of the nobles, who in many instances sold their lands and their rights in order to obtain money for the expedition. By weakening the nobility, they increased to some extent the power of the king and of the common people. The crusades did much to increase the power of the Church and the papacy; for a crusader on starting out often intrusted his property to the Church, which, if he did not return, became so much the richer.

Commerce and Learning. — Among the most important of their good effects were the stimulation of commerce and the spread of learning. They opened the East to trade and the products of Asia were introduced into Europe. The knowledge of geography was of course increased by these expeditions, and, as the Arabs were in advance of the Christians in scientific learning, Europe profited from contact with them. In fact, the crusades did much to bring about the revival of learning in the West.

CHAPTER XXXVI

SOCIETY IN THE MIDDLE AGES

I. FEUDALISM

Definition of Feudalism.—Feudalism is a social system in which the ownership of land is the basis of authority. At the present time in the most civilized countries the tenant on any man's estate owes him no duties save the payment of a money rent. He is free to go and come as he likes, and can give up his holding as soon as the lease expires. In the Middle Ages the right to hold land and cultivate it was accompanied by certain duties on the part of the holder to the person from whom the land was held. The latter had to some extent a political control over his tenant. He was called the suzerain, liege, or lord, and the person who was allowed to occupy the estate was called the vassal, liegeman, or retainer. The estate itself was known as a fief.

A COURT JESTER

The Origin of Feudalism.—It is very difficult to trace the origin of this social system, and among historical scholars almost every point in its early development has been a subject of dispute. It is certain, however, that it resulted from the fusion of the German invaders with the native Roman population. When the German tribes crossed the frontiers and settled on Roman land, the conquered country was divided as plunder among the invaders. Every free German acquired a small parcel of land in his own right, and this was known as an *allod*. The only duty which the owner of this land owed to the state was military service.

Besides these allodial lands, or freeholds, however, there were other tracts which were held on a different principle.

The early Middle Ages were a period of constant warfare, and almost the only way in which a king could attach a fighting man to himself was by bestowing on him a piece of land as the price of his service. In conquering a country, the king of course acquired the largest share, and from this share he often granted to his personal followers and faithful courtiers certain tracts, on condition that they should continue to stand by him. Such a gift of land was termed a feudal grant, the land itself being a *fend* or *fief*. In the first place, the gift was merely for life, but in the course of time it became hereditary. If the son inherited the fief, however, it was understood that he was to continue rendering his lord the services which his father had been obliged to render.

In many cases the land was obtained not by grant from the lord, but by usurpation. A man who had been set over a certain district as its governor often succeeded in gaining a sort of ownership and in making the land hereditary in his family. Thus from being a mere agent of the king, he became the king's vassal and the feudal lord over this district. Another way in which the fiefs arose was by the voluntary surrender of freeholds or allodial estates in order that they might be received back as fiefs. This was to secure the protection which, in a period of violence, some more powerful person could render. The free man thus became a vassal for the sake of his own security.

Subinfeudation. — Just as the king granted out parcels of land to his followers in return for feudal service, so the king's vassals granted out portions of land which they held from him. This process was called *subinfeudation*, and resulted in making successive grades of landholders, each the vassal of the man from whom he held the land, and the suzerain of the man who held from him. A man's allegiance, therefore, was not due directly to the king, but to his feudal lord, and this, of course, tended to weaken the royal authority.

Relations between Lords and Vassals. — The vassal was required to take an oath of fidelity to his lord, declaring himself

to be the latter's man. This ceremony, by which the fief was secured, was known as *homage*. The chief duty of the vassal in the warlike times of the Middle Ages was military service. He was obliged to serve his suzerain in war, and, if necessary, to lay down his life for him.

The lord had certain judicial rights over the fiefs which he had granted, and certain financial claims which were known as feudal aids. These included a requirement to pay money for the ransom of the lord, and on the occasion of the knighting of his eldest son and the marriage of his eldest daughter. These were the main legal aids, but other contributions were occasionally required.

On the other hand, the lord owed the duty of protection to his vassal. So we may sum up the relations of lord and vassal by saying that on the one side there was the duty of protection, and on the other the duty of service. In fact, the relation between them was very similar to that between the king and his subject. In several important respects the lord enjoyed sovereign rights over the lands of his vassals. He levied troops and administered justice and raised money. When the king bestowed a fief upon a vassal, the grant carried with it these sovereign rights, or 'immunities.' If it is asked why the king should be willing to part with these rights, it can only be said that there was no other means by which he could purchase the loyalty of his followers.

The Extent of Feudalism.—The period of the most rapid development of feudalism was under the later Carolingians in the ninth century, and it reached its highest point in the twelfth century. At that time it was the universal system of government in Europe; but while in its main principles it was the same, it differed in many important details, in different countries and even in different parts of the same country. At the time of its highest development, Europe was composed of a vast number of almost independent fiefs, and the royal authority was hardly greater than that of the principal vassals.

The Theory of Feudalism. — The central idea of feudalism was that the ownership of land carried with it the right of sovereignty over the people dwelling on the land. The king, according to the mediaeval notion, was the vassal of God, holding his kingdom as a fief bestowed by God. He granted certain portions of his kingdom to his followers in return for feudal service. They exercised a part of his authority over these estates and enjoyed his protection. They, in turn, granted portions of their land to others, who became their vassals, and these regranted it to still others.

There was thus a regular descending scale from the king to the lowest vassal, each man rendering homage to the man above and protection to the man below. In the event of a war, the king called upon his immediate vassals, and they, in turn, upon their vassals, and so the army came into existence upon demand, each soldier obeying the command of his liege.

The Defects of Feudalism. — The main body of the population under the feudal system consisted of serfs and villains. The serfs were laborers or servants, and completely at the mercy of their lords, but could not be bought or sold. The villains belonged to a little higher class, but were, like the serfs, completely subject to the will of their masters.

The chief defect of feudalism lay in the weakening of the royal power. Each feudal lord was virtually a sovereign on his own domain and his power was often used tyrannically. Moreover, the vassals were constantly engaged in private war and society was in a condition of disorder. The people had no redress against the oppression of the barons, for the magistrates to whom alone an injured party could appeal belonged themselves to the nobility.

The Decay of Feudalism. — Both the king and the common people were opposed to the system, and it was therefore attacked from above and below. The king naturally sought to curtail the power of his vassals, and the common people often fled from their lords to take refuge in a city. The cities grew in

strength, and partly by purchase and partly by force secured independence from their lords.

Among the causes which contributed to the downfall of feudalism were, first, the crusades, in which many of the nobility lost their lives or became impoverished, and second, the change

GERMAN WALLED TOWN

in the art of war, owing to the introduction of gunpowder. This rendered the peasant as formidable as the armed knight. By the middle of the fifteenth century, feudalism was already far on the decline, and before the close of that century absolute monarchies made their appearance in Spain, France, and England.

II. CHIVALRY

Feudal Society. — In the Middle Ages society was divided into three classes: the nobility, the citizens or inhabitants of the towns, and the peasants or tillers of the soil.

The Nobles. — The main office and aim of the nobility was to fight. Their castles were really fortresses, surrounded with thick walls and a ditch. A strong gateway guarded the entrance to the castle, and a passage through the gateway could be closed by shutting down from above a porteauillis, or grating. The ruins of many of these castles survive to-day and

bear witness to the strength and formidable character of the dwellings. At first nobility was not a matter of birth alone, for wealth could purchase entry into its ranks. In the thirteenth century, however, nobility became hereditary, and from that time intermarriage between the higher and lower classes was less frequent.

The Citizens and Peasants. — The inhabitants of the cities came in the course of time to enjoy the right of self-government; for, as the cities increased in wealth, they were able to resist the claims of their feudal lords and became feudal persons themselves with vassals of their own. The condition of the peasant was wretched. Whether he was a villain or a serf, the peasant's life was precarious and his well-being depended upon the caprice of his lord.

The Knights. — The strength of the feudal army consisted mainly in its cavalry. The common people fought on foot, but any one who had the means of equipping himself with armor and a horse became a member of the cavalry. His rank was that of a gentleman, and he was called a cavalier or knight. The word 'chivalry' is by derivation associated with *chevalier* (cavalier) or knight. In the broad sense, however, it applies to matters

MEDIAEVAL HUNTING HORN

of military exercise and feudal etiquette.

The Origin of Chivalry. — The customs and ideas which characterized chivalry arose from the fondness of the Teutonic races for a warlike life and their gallantry toward the female sex. It was required of every young nobleman that he should follow the profession of arms. First he had to serve an apprenticeship of several years as the companion or squire of a knight. In this office he was engaged in personal service about the castle in times of peace, and in war or on the occasion of a

tournament he followed his lord and led the war horse. In battle he clothed his master in armor and attended him in the fight, it being the squire's duty to come to his aid if at any time he saw him hard pressed.

After this apprenticeship the young man was eligible to knighthood. He was raised to the rank of knight by a peculiar ceremonial. Having fasted, spent a night in prayer, and attended

A TOURNAMENT

mass, he was required to pass an examination to ascertain if he was worthy of admission to the order of knighthood. He then took certain vows, promising among other things to be a loyal, just, and gentle knight, to redress the wrongs of widows and orphans, to protect ladies, and to champion the Church. He was then equipped with the proper dress and armor of the order, and the ceremony was completed by the

lord's striking him a blow on the neck with the flat side of his sword.

Amusements of Chivalry. — The most famous amusement of the chivalrous age was the tournament, which took place in an open space surrounded by a balustrade or a rope, called the lists. It was a mimic combat between knights, who each tried to unhorse the other with his lance. The successful knight was hailed with shouts of applause from the spectators and received a prize from his mistress or the queen. Other amusements of a less dangerous nature were hawking and hunting.

The Character of Chivalry. — In some respects the effect of chivalry was ennobling. It promoted the virtues of bravery, loyalty, courtesy, and generosity. It was regarded as an order of merit, and a man was not entitled to knighthood by birth alone, but had first to prove that he was worthy of the honor.

The spirit of the institution was religious as well as military. The knight was supposed to serve Christ by the purity of his life as well as by fighting for the cross. Moreover, it developed a fine sense of devotion and tended to elevate the position of women. In a barbarous time its influence was to soften the rough manners and enhance the humanity of men.

The enthusiasm which chivalrous ideas aroused took shape in a great body of literature, and this literature was written no longer in the old Latin tongue, but in the native languages of the French, Italians, English, and Germans.

On the other hand, chivalry too often degenerated into a mere matter of form and etiquette. It gave impulse to lawless adventures, and undue eagerness for military fame. It outlived its usefulness and became ridiculous.

CHAPTER XXXVII

THE PAPAL POWER

Introduction. — Some of the influences that led to the supremacy of the Roman bishop in Europe have already been described. We have seen that the pope in the course of time became not only a spiritual ruler, but a secular prince, and that he claimed supremacy over kings and emperors. His supremacy in religious matters was early admitted in western Europe. It now remains to see how far he succeeded in gaining temporal power. Italy, it will be remembered, was, in theory at least, a part of the Holy Roman Empire of the German Nation. The relations of the pope to the emperor became a matter of great importance, and during a large portion of the Middle Ages there was a struggle for supremacy between the two. The imperial party held that the emperor, as representing the highest civil authority in the world, was

superior to the pope, while the papal party held that the pope, as the vicar of God on earth, was above all earthly rulers.

The Choice of Popes. — Down to nearly the middle of the twelfth century there had been much confusion in regard to the system of papal elections. Kings and nobles had often interfered in the choice of popes and caused men to be chosen merely because they were likely to favor their interests. On many occasions the German emperors had acted as if the Holy See were an office at their own disposal, and the result had been the degradation of the papacy and its subjection to the emperor.

Reform of Church Discipline. — A young monk named Hil'debrand (afterward Gregory VII.), who had been educated at the Abbey of Clu'ny in France, came to Rome on the occasion of a papal election in 1044, and saw the abuses of the system. He thought that the only way to secure peace and honesty in papal elections was to transfer the choice of the pope to the clergy. In 1048 he came to Rome and soon rose to the rank of Cardinal. For many years, although he was not pope himself, he really controlled the policy of the papacy, and worked steadily to make the Church pure within and independent of all earthly power. To accomplish these things, he thought it necessary to change the method of electing popes, to take action against the vices of the clergy, and to make ecclesiastics more completely subject to the Holy See. He did his best to uproot the evil known as simony, which consists in the buying and selling of appointments to office in the Church;

for this practice tends to make the clergy the mere tools of the civil ruler. Another matter on which he insisted was the celibacy of priests, for he held their marriage to be in violation of the laws of the Church. He succeeded in advancing these re-

BISHOP'S CROSIER

forms, and the effect of his efforts was greatly to increase the power of the Church.

Reform of Papal Elections. — In the matter of the election of popes he was equally successful. On the death of Pope Victor II. Hildebrand saw a chance for introducing his proposed reform; for the emperor on the German throne, Henry IV., was then a mere child. The new pope was chosen by the Roman clergy and people, and quite independently of the choice of the emperor. In 1059 the new method of papal elections was formally decreed, and thenceforth the choice of the popes was made by a small assembly of the high dignitaries of the Roman Catholic Church; in other words, the Sacred College of Cardinals.

Gregory VII. — Hildebrand was elected pope in 1073 under the title of Gregory VII., and though chosen unanimously, accepted the office unwillingly, for he knew what difficulties awaited him. In the first year of his pontificate he issued decrees against the marriage of priests and the purchase of the Church offices. This caused a great storm among the clergy, but in the end the law of celibacy prevailed. He tried also to carry out the other reform which he had at heart; namely, the removal of the clergy from subjection to the state. To do this it was necessary to wrest from the emperor powers which both he and his predecessors had constantly exercised.

Investiture. — The question was whether the civil ruler could grant Church offices at will. The bestowal upon a candidate of the symbols of office was called investiture, and the struggle between the emperor and the pope is sometimes known as the War of Investitures. It had become the custom for the feudal lords to bestow on the bishops and abbots the symbols of their office without distinguishing between their secular and their ecclesiastical rights. Thus the feudal lord appeared to be the source of spiritual power. The emperor claimed this as a right and had frequently practiced it.

Contest between Gregory and Henry IV. — In 1075 Gregory issued a decree forbidding any one to receive a Church office

from a lay power. To this the emperor refused to submit, and, after bringing to a close a war which he was waging with the Saxons, he went on selling Church offices as usual. Gregory summoned him to Rome, but the papal ambassadors were driven from the emperor's courts with insults. At Rome a plot was formed against the pope, and he was seized and imprisoned by one of the Roman nobles, but an uprising of the people caused his release. Henry called a council which declared the pope deposed, but the pope retorted by excommunicating Henry. The latter was hampered by troubles with his German subjects, many of whom were glad to take sides with the enemy.

Canossa (1077). — Henry was soon deserted by his followers, and arrangements were made for summoning a diet to consider the question of his deposition. The pope was invited to preside at the diet, which was to meet in Germany. Henry was now afraid of losing his throne, and he tried to obtain an interview with the pope before the latter started for Germany. The pope did not wish this, but Henry went into Italy and intercepted him at Canossa (1077), where he implored forgiveness and promised to yield to all the pope's demands. Before Gregory granted this request, he required the emperor to undergo a painful and humiliating penance, standing for three days, it is said, barefoot in the snow. At last he was admitted to the castle at which the pope was staying and forgiveness was granted on condition that he present himself for trial at a later time and that he respect the rights of the Church.

Henry had now gained what he wished, and proceeded to break all his promises. He was successful in his war with the nobles of Germany and defeated the forces of the pope. Finally, invading Italy, he gained access to Rome, and Gregory was driven into exile.

Death and Character of Gregory VII. — Gregory died at Salerno in 1085, saying, as he approached his end, the often-quoted words: "I have loved justice and hated iniquity; therefore I

die in exile." Apparently he had failed to realize his great aims, but in reality he had done more to increase the power of the papacy than any pope that had preceded him; for he had mapped out the policy which his successors on the papal throne carried to success, and this policy raised the papal power for a time above all the civil rulers of Europe.

It was his theory that the papal power in spiritual matters was the highest in the world, and that emperors and kings could be compelled to obedience by spiritual weapons. He thought that the great evil of his time was the dependence of the clergy upon the civil ruler, which obedience was maintained by the emperor's exercise of the right of investiture; for the emperor gave not only the symbols of secular power, but of spiritual. The clergy under this system were vassals of the crown; Gregory wished them to be under the sole power of the Church. As to his personal character, no one, not even his enemies, denied his sincerity and unselfishness. He was, moreover, the greatest man of his time, and his work left its stamp upon the Church for centuries.

Henry V. — Gregory's great rival, Henry IV., outlived him twenty-one years. The latter part of his life was full of misfortunes and embittered by the revolt of his son. The new emperor, Henry V., was a more dangerous enemy of the papacy even than his father. He claimed all the rights that the latter had exercised, and, entering Rome, obliged the pope to crown him emperor and acknowledge the imperial right of investiture. As soon as Henry left Italy, however, the pope renounced his promise, and the struggle continued ten years longer. Finally, after nearly half a century had passed since the quarrel between Henry IV. and Gregory, a settlement was reached by the Concordat of Worms in 1122. This was of the nature of a compromise; for while it was seen that the empire was too weak to enforce its claims to supremacy, it appeared still too strong to be made completely subordinate to the popes.

Concordat of Worms. — The Concordat of Worms was an attempt to settle the matter without humbling either party.

By it the emperor agreed to give up the right of bestowing the symbols of Church authority and to acknowledge the free election of the clergy by the clergy. The pope, on the other hand, agreed that the emperor or his representative should be present at the elections of clergy, provided that bribery or intimidation was not employed. The emperor also was to bestow crown properties as before. Thus neither party gained all that it had been striving for, and neither had the right to bestow both spiritual and secular authority. These rights were divided between the two, the pope bestowing the signs of spiritual authority and the king bestowing the signs of temporal.

Nevertheless the Concordat of Worms was really a triumph for the Church. The long struggle had shown clearly the great power of the popes, especially in its effect of weakening the loyalty of the feudal vassals of the king. As the great crown vassals became stronger, the power of the emperors was lessened. Moreover, the popes, being the natural allies of all enemies of the emperors, took sides with the cities which, although legally the vassals of the emperor, were fast increasing in power and asserting the right to govern themselves.

Another effect of the weakness of the emperor and his hostility to the papacy was to make the popes and not the emperors the promoters of the crusades, an office which would naturally have fallen to the lot of the emperor in his capacity of defender of the faith. The popes received the credit for the crusades, and acquired as a result of them a far greater influence in Europe.

Frederick I. (Barbarossa) and the Papacy. — Frederick Barbaros'sa, one of the ablest of all the German emperors, was a far more powerful enemy than the popes had yet encountered. He came to the throne with a fixed resolve to extend the powers of his empire, and one of the first difficulties that he attacked was the growing independence of the Italian cities. They had united with the Church vassals and had gained such a measure of local self-government as to threaten the imperial

power over them. He treated them as his fiefs and demanded the usual feudal services. The cities refused these demands and Milan, being the chief offender, was the first to suffer punishment. A large part of the city was destroyed; a portion of the walls were pulled down and the inhabitants were forced to a humiliating surrender.

This, however, did not break the spirit of these cities, and the so-called Lombard League was formed under the leadership of Milan. Then followed a sharp conflict between the emperor and the league. But in spite of his energy and ability he made no headway against it, and finally in the battle of Legna'no (1176) was completely defeated. One of the chief reasons for his failure was the disloyalty of the German princes.

Treaty of Venice — In 1177, he made with the pope the famous Treaty of Venice, whose terms were greatly to the disadvantage of the emperor; for the pope no less than the cities had profited by the victory at Legnano. In the Treaty of Venice, Frederick virtually acknowledged that the imperial power was secondary to the papal.

The terms made with the cities were very important. According to the feudal laws, the allegiance of the latter was due to the emperor as their overlord. But he was obliged to yield his lawful claim and grant the cities the right of self-government. These concessions were made by the Treaty of Constance in 1183.

Decay of the Imperial Power. — These events mark another stage in the great papal and imperial conflict. The Concordat of Worms in 1122 was, as we have seen, a compromise in which the advantage was on the side of the Church. The renewal of the conflict by the emperors in the hope of regaining what had been lost resulted in a still greater triumph for the Holy See in the treaties of Venice and Constance. A great blow was dealt to the power of the empire. The cities were independent, the Church was hostile, and the nobles were defiant; and although Frederick and his successors struggled bravely to

maintain the power of their house, the foundation of the empire was shattered, and after the death of Frederick II., in 1250, the imperial throne became the prize of any one who was strong enough to seize it.

Innocent III. (1198-1216).—The reign of Innocent III. marks the highest point which the papal power ever attained. He followed in the footsteps of Gregory VII., aiming constantly at the supremacy of the Church over the State.

The success with which he carried out this policy is illustrated by his contests with Philip Augustus of France and John of England. Before Innocent came to the throne, Philip Augustus had divorced his wife and illegally married Agnes of Meran. The divorce had been approved by the highest ecclesiastical authorities in France, but the ex-queen appealed to Innocent III., who saw an opportunity to test the question of papal supremacy and determined to force Philip Augustus to put away his new wife. The king paid no attention to the pope's demand, for he trusted to the loyalty of his people and felt himself strong enough to resist.

The pope thereupon inflicted the severest punishment that the Church had in its power. He laid the kingdom under an interdict. This meant that all the offices of the Church were suspended, with the exception of the most necessary sacraments. The Church doors were closed, the dead were buried in unconsecrated ground, and the people were deprived of the consolation of religion. To a pious people this was unendurable, and the pressure on the king to comply with the pope's demand became too strong to be resisted. Philip Augustus finally yielded and sent away Agnes of Meran, who died soon afterwards. Since Philip Augustus was one of the strongest as well as the most headstrong monarch in Europe, this triumph was a remarkable proof of the pope's power.

Contest with King John.—In the quarrel with John of England the issue was not a matter of personal morality, but of Church authority. There was a dispute about the election to

the Archbishopric of Canterbury, the most important Church office in England. The monks of Canterbury chose one candidate and the king another, and then both parties appealed to the pope. Innocent rejected both candidates and proposed one of his own, Stephen Langton, a man in every way suitable for the office. John refused to submit, and the pope used against him the same means that had been employed to coerce Philip Augustus. He laid England under an interdict, and, though

CANTERBURY CATHEDRAL

its effect was not so immediate as in France, it finally brought John to terms. Not only was John obliged to accept the pope's candidate, but he went so far as to surrender the kingdom of England to the pope and receive it back as the pope's vassal, paying in token of vassalage a sum of money each year.

Suppression of Heresy. — Innocent was equally vigorous in

suppressing heresy, and in doing so he employed the same means as were used against the infidels. A crusade against the Albigen'ses, an heretical sect in southern France, was undertaken and carried out with success, but was marked by revolting cruelties.

Decline of the Papal Power. — The popes continued to wield a vast power for many years after the death of Innocent III. They were strengthened by two new orders of monks which were founded early in the thirteenth century and named after their founders, St. Dom'inic and St. Francis. These Dominican and Franciscan monks returned to a more rigid discipline and a more complete exclusion from worldly things, and having no ambitions or hopes outside of the Church, they directed all their efforts to advancing its interests, and were staunch supporters of the pope.

But toward the close of the thirteenth century, the papal authority began to show signs of weakness, and as the reign of Innocent III. illustrates the power of the popes, their waning influence can also be illustrated by an example. Boniface VIII., who ruled from 1294 to 1303, became involved in a quarrel with Philip IV. of France over the question of taxing the clergy. Philip claimed that right, and when Boniface ordered him to desist, saying that he was subject in spiritual things to the Holy See, Philip returned a defiant answer. Although Boniface issued decree after decree against him, placed him under the ban and declared him deposed from the throne, the king gained his point; for the people were on his side. In the Assembly of the States-General, it was declared that France was not subject to the pope in temporal matters. For many years after this the papacy was wholly subject to French influence, and in 1309 the Holy See was removed from Rome to Avignon', in France, where it remained for nearly seventy years (1309-1378), a period known in Church history as the Babylonian Captivity of the Church. As a natural result of this, the respect for the papacy declined.

The Great Schism (1378-1417). — The removal of the papal

seat to Avignon gave offense to the Italian members of the Sacred College, and they chose a pope who promised to take up his residence at Rome. The French cardinals, preferring Avignon as the seat of the pope, chose an antipope of their own. There was thus a division or schism in the Church, and there were for many years two lines of popes. This of course weakened the influence of the papacy, for people did not know who was the rightful pope.

Council of Pisa. — These years were a dark period in the history of the Church, and the evils of the time led to efforts for reform, notably the movements of John Wyclif and John Huss. Finally, as the only way of settling the matter, a council of the Church was called to decide who was the just claimant to the papal throne. This council, which assembled at Pisa in 1409, recognized neither of the popes, and set up a third one; but as both the deposed popes insisted on maintaining their rule, the decision of the council only made matters worse, for there were now three popes instead of two.

Council of Constance. — But the Council of Constance was more successful. After deposing the three popes, it chose Martin V., in 1417, and he was generally acknowledged. This brought the Great Schism to an end, but the effect of it was none the less important. The papacy thenceforth had no chance of gaining that supremacy over the civil power which was aimed at by Gregory VII. and his immediate successors.

Conclusion. — As a result of the long struggle between the papacy and the civil powers, it may be said that the attempt to make the Church supreme in temporal matters had failed. As the Middle Ages drew toward their close, the feeling of nationality became stronger and the power of the kings increased. Both these facts tended to lessen the authority of the popes when they interfered in secular affairs. On the other hand, their spiritual supremacy remained. Here and there it was questioned, and reform movements were started; but throughout the fifteenth century the Holy See continued to be the highest authority in spiritual matters. It was not

till the following century, that any of the states of Europe ventured to separate from the Roman Catholic Church.

CHAPTER XXXVIII

ENGLAND IN THE MIDDLE AGES

The Norman Conquest. — It is said that the Anglo-Saxon king, Edward the Confessor, promised the succession to William, Duke of Normandy, and that the promise was renewed by Harold, the heir to the throne. These alleged promises were the grounds of William's claim, and when Harold became king on Edward's death, the Norman duke, accusing him of perfidy, prepared to invade England. Harold was brave and determined, but his enemies were more numerous and better disciplined, and in the battle of Senlac or Hastings (1066) his forces were routed and he himself was killed. Thus the old Anglo-Saxon dynasty came to an end, and the chief power in the state passed into the hands of the Normans. During the next hundred years the two races gradually mingled, and the result was a civilization that was neither Anglo-Saxon nor Norman, but a fusion of the two. This complete fusion of the races was chiefly due to the fact that both traced their origin to a pure Teutonic ancestry.

I. THE NORMAN KINGS¹

William the Conqueror (1066-1087). — Although William really ruled "as king by the edge of the sword," he preferred to base his title on the promise of Edward the Confessor rather than on force of arms; and he adhered so far as possible to Anglo-Saxon usages, causing himself to be crowned at Westminster and binding himself to frame good laws and observe justice, as his predecessors had done. In fact he professed to

regard himself as the lawful successor of the Anglo-Saxon kings, and not merely as a feudal conqueror. He had great difficulty in making the people recognize him as such, but when this was once done, he was a far more powerful ruler as king of England than he was as Norman duke.

The Anglo-Saxons were a sturdy race, and William's power was not fully established till 1071, when the brave native

WILLIAM THE CONQUEROR, AS REPRESENTED ON HIS SEAL

chieftain Hereward was driven from his stronghold in the marshes of Ely. The revolts of the natives left them in a worse position than before, for more of their land was confiscated and granted by the king to his Norman vassals. All the higher offices were filled with Normans, who became the ruling class, and the Norman system of government, in which feudalism was further developed than in England, was introduced.

Yet William retained many of the Anglo-Saxon institutions,

especially in the lower branches of the administration. He showed good statesmanship in the way he parcelled out the land among his followers. To avoid the danger of placing too much power in the hands of his vassals, he did not grant large continuous tracts of land to single persons, but gave each separate estates, often in different counties.

Doomsday Book. — A survey of the land was carried out in the winter of 1085–1086, and its results were embodied in the *Doomsday Book*, which contains a careful and minute description of the lands of the kingdom, an estimate of their value, and an enumeration of the various classes of landholders. It is a remarkable work, and one of the chief sources for the history of the political and social conditions of the time.

Character of William's Government. — One of the chief defects of the feudal system was that the king was cut off from the common people through the intermediate vassals, to whom service was due rather than to the king. To remedy this William required all land-owners to take the oath of fealty to himself. He preferred to rule as the king of a nation rather than as a feudal lord, and the people came to see that their interests were better served by him than by the nobles, or barons. The troubles of his reign were between the king and the nobles, not between the king and the common people. He was harsh, but impartial, and he maintained the public peace and repressed the lawlessness of the barons.

NORMAN GATEWAY, WINDSOR CASTLE

William II. (Rufus, 1087-1100). — William the Conqueror was succeeded by his second son, William Rufus, who, though cruel and passionate, inherited some of his father's ability. He, too, saw that it was good policy to win the favor of his English subjects. Two insurrections broke out in his reign, and both were put down largely through the aid rendered by the English. He was murdered in the New Forest in 1100.

Henry I. (1100-1135). — Henry I., the younger brother of William Rufus, came to the throne in spite of the opposition of his brother Robert, who as the eldest son of the Conqueror had inherited Normandy. Henry succeeded in gaining the support of the people by issuing a charter of liberties and by his marriage with Matilda, a descendant of the old Anglo-Saxon line. He was, moreover, the first of the Norman kings who was born in England. When he found himself secure on the English throne, he took advantage of Robert's weakness

and invaded Normandy. The result was the defeat and imprisonment of Robert. Henry was now Duke of Normandy as well as king of England, and both titles were transmitted to his successors. The fines imposed upon his enemies and the confiscation of their lands greatly added to the royal power and correspondingly weakened that of the barons, but Henry used this power wisely. To the nation at large he promised, in the charter of liberties, to restore the Anglo-Saxon laws, and the general object of his policy was to strengthen the lower orders of society and make them his friends, as an offset to the power of the nobility. A selfish but politic ruler, he saw the identity of his own interests with those of the people, and in helping them he helped himself. He was peace-loving and administered even-handed justice. "No man durst misdo against another in his time," says the Anglo-Saxon Chronicle.

Stephen (1135-1154). — Disregarding the claims of Henry I.'s daughter Matilda, Stephen usurped the throne and by his energy and boldness succeeded in holding it. He followed the example of his predecessors in trying to win over the English by promising to administer justice and abolish unfair taxation, but in the troubles of the reign these pledges were little regarded. His reign, in fact, was one of the worst in English history. He was constantly at odds with the nobles, and the country was distracted by civil wars. The Scots, Matilda's allies, invaded the north of England, and though they were routed in the Battle of the Standard, Stephen did not know how to profit from his victory. He had been foolish enough to allow the barons to build strong castles, and when his misgovernment provoked them to revolt, he found the country dotted with hostile fortresses. Nor did peace bring much benefit to the people, for these castles became the shelter of tyranny and robbery. "There are as many tyrants as there are lords of castles," complains a historian of the time. The anarchy and violence of the time have caused it to be regarded by some as the darkest period of English history.

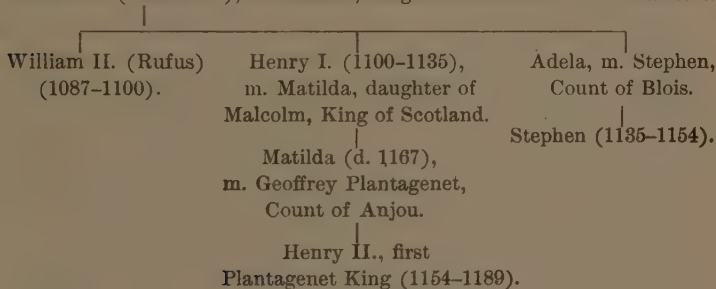

At last, however, Stephen came to an agreement with Matilda's son Henry, acknowledging him as his successor and promising to restore good order in his kingdom.¹

II. THE PLANTAGENETS TO 1399²

Henry II. (1154-1189). — Henry II. was the son of Geoffrey Plantag'enet and Matilda, the daughter of Henry I., and the first of the Plantagenet dynasty, which ruled England in the direct line till 1399. Inheriting wide domains in France, he ruled over a greater extent of territory than any previous English king. His aim as a ruler was to systematize and centralize the government and to weaken the power of the barons. He destroyed many castles of the nobles, and by

accepting money in place of military service secured the means of supporting a military force of his own.

Thomas à Becket. — During the early years of the reign Thomas à Becket, as the king's chancellor, had shown great zeal in his cause, but, being appointed archbishop of Canterbury in 1162, he devoted himself wholly to the interests of the church and the exaltation of his office, and became the most dangerous of the king's foes. The main point at issue between them was the trial of members of the clergy who had been guilty of crime. The civil courts had lost all authority

DEATH OF BECKET

over clerical offenders, who were tried by the church tribunals. But the latter bodies could inflict only spiritual penalties, and serious offenses often went without adequate punishment. In the Constitutions of Clarendon (1164) it was decided that ecclesiastics accused of crime must first be summoned before the king's justices, who were to determine whether the offense came within the jurisdiction of a secular or a spiritual court.

Becket reluctantly agreed to this, as well as to other provisions seriously affecting the authority of the church, but soon afterwards sent to the pope and asked forgiveness for what he had done. The king's party was powerful, and Becket took refuge in France, but a few years later, through the aid of the pope and the French king, was reinstated. On his return to England he angered the king by excommunicating the bishops who had taken sides against him. Henry, in a moment of rage, spoke some hasty words, which were construed by his attendants as a wish for the murder of Becket. They broke into the cathedral where the latter had taken refuge and killed him at the altar (December, 1170). Becket was now regarded as a martyr and a patron saint, and the king was finally obliged to make his submission to the papal representative and declare on oath his innocence of all complicity in the murder. Thus the apparent outcome of the struggle was unfavorable to the king, but in reality Henry gained the main object for which he had been working. The church courts no longer enjoyed such complete authority over criminal members of the clergy.

General Results of Henry's Reign. — Henry greatly strengthened the monarchy. He improved the administration of justice and lessened the power of the nobles. In his struggle with Becket he tried to maintain the supremacy of the state over the church, and in this he was in large part successful.

The Invasion of Ireland. — At this period Ireland had made little progress in civilization. To conquer it and make it an English dependency was long a favorite scheme of Henry's. In 1155 Hadrian IV., the only Englishman that ever occupied the papal throne, issued a bull approving the plan and declaring it to be his will that the Irish should recognize Henry as their lord. Nothing was done for several years, but in 1169 a quarrel between two Irish chiefs gave the English a chance to interfere, and a number of barons, headed by Richard of Clare, surnamed Strongbow, established themselves in Ireland. They acknowledged Henry as the feudal lord over the lands which they had seized, and a large part of the country which

was still ruled by native chiefs also submitted to him. Finally, by the Treaty of Windsor (1175), Roderick of Connaught recognized Henry as his feudal sovereign and in turn was acknowledged by the latter as king over all those parts of Ireland which were not held by the English. But Ireland was by no means conquered. Irish laws and customs still prevailed, except in the parts colonized by the English, and the subsequent history of the country is concerned with the spread of English laws and the extension of English authority from the little strip of territory in the east known as the Pale.

Richard I. (1189-1199). — Richard's reign was that of an absentee king, for he passed but a few months in his own country. Military glory was the passion of his life, and England was to him merely the source of supplies for his continual and profitless wars. The part which he played in the third crusade has already been described. On his return he was soon engaged in war with Philip Augustus of France. To meet the enormous expenses of this lavish and imprudent prince, excessive taxes were imposed upon the people. But the results were not altogether bad, for the justiciar was a wise administrator, and in order to get the most out of the people with the least oppression systematized the methods of taxation and even provided for a sort of representation. Thus a better and more equitable system of taxation was established.

John (1199-1216). — John is regarded as the worst king that England ever had, but his reign has had more important consequences than that of any other English sovereign. The events of the reign may be grouped under the following heads: (1) Foreign Affairs; (2) Relations with the Church; (3) Struggle with the Barons.

John's Foreign Possessions. — In France John held Normandy and Aquitaine, but his claim to Anjou, Maine, and Touraine was disputed by his nephew Arthur. While as king of England he had no superior, he was, according to feudal law, the vassal of the French king Philip for his possessions on the Continent. Having offended a powerful family in France by

a foolish and unworthy act, he was summoned by Philip to trial as his vassal. John refused to obey, and Philip thereupon declared him to have forfeited his fiefs. Even after this John took Arthur prisoner and murdered him. Philip summoned him a second time, and upon John's refusal invaded the latter's French dominions. By the summer of 1204, Philip was supreme in Normandy, Maine, Anjou, and Touraine. Thus the English power on the Continent was swept away.

John's Relations with the Church. — John suffered an equally severe humiliation as a result of his resistance to the papal authority. His attempt to appoint a candidate of his own to the archbishopric of Canterbury brought on that quarrel with Innocent III., the outcome of which has already been cited as an instance of the great power wielded by the popes at that time. Innocent laid the kingdom under an interdict (1208) and the next year excommunicated the king. John seized the estates of the clergy and forced many to leave the kingdom. But the pope issued a bull deposing him and commissioned Philip of France to drive him from the throne. John was as abject in surrender as he had been arrogant in resistance. He not only accepted the pope's candidate, Stephen Langton, but surrendered the kingdom to the pope and received it back as a fief subject to tribute.

John's Struggle with the Barons. — One of the many grievances of which John's subjects complained was the excessive taxation. He levied exorbitant taxes on the pretense of carrying on a military campaign, and then disbanded the army without attempting to fight. For instance, in 1205, when an invasion was feared, he assembled a great force and began preparations for carrying the war into France. He himself started out as if to lead the expedition; but he went only a short distance and then returned, disbanded his troops, and accepted money. When he led an army into France he had some success; but his allies suffered a disastrous defeat at Bouvines (1214). He was despised for his cowardice and hated for his extortions. At last the barons drew up a scheme of reforms;

and though the king held out for a while, his friends soon fell away, and at Runnymede, on June 15, 1215, he was compelled to sign the famous Magna Charta (Great Charter).

Magna Charta. — The Great Charter is one of the most famous documents in history. It is regarded as the foundation of the civil liberty of Englishmen. Yet many of its principles had been long recognized. Men could point from Magna Charta back to the charter of liberties in Henry I.'s reign, and from that to the laws of Edward the Confessor, and from these to the laws of Alfred. This constant regard for precedent and refusal to break with the past is the characteristic of Anglo-Saxon political history. Nevertheless many privileges which

were formerly a mere matter of usage were now expressly guaranteed, and it was a great gain to have the rights of subjects acknowledged in a written instrument. The important principles declared by Magna Charta are, (1) No taxes shall be levied without the consent of the great council of the realm. (2) No free man shall be seized or imprisoned except through the loyal judgment of his peers. (3) Justice shall not be denied to any man; nor shall it be bought and sold.

KNIGHT OF THE THIR-
TEENTH CENTURY

John agreed to this charter, but very soon broke his promises. War with the barons resulted, and the king was successful. The barons now called in the aid of

the French prince Louis, the son of Philip Augustus, but before a decisive battle could be fought, John died (1216).

Henry III. (1216-1272). — In return for Louis' aid the barons had agreed to acknowledge him as their ruler, but now that John was out of the way they turned against him and drove him out of England. Henry III. was but nine years old when he was crowned. As he grew older, it became evident that he was totally unfit to rule; for while he was

gentle and kindly, he was capricious, vain, and weak. His foreign ventures ended in failure and created an enormous debt. His misgovernment finally led to the assembling of the so-called 'Mad Parliament,' which set up committees of barons to control the king. This arrangement soon broke down, and for a time there was civil war. Simon of Montfort, Earl of Leicester, was the leader in the opposition to the king, and in 1265 he took the important step of summoning representatives of the cities to meet in Parliament, and many of the common people who had shown themselves faithful to the cause of liberty were also bidden. This was the beginning of the English House of Commons. In the same year Simon of Montfort was defeated and killed, but not before he and his party had secured all that they had fought for; and during the rest of Henry's reign the kingdom enjoyed constitutional government.

Edward I. (1272-1307). — Edward I. was a great contrast to his father. He was a brave and skillful soldier, a trained lawyer, an able organizer, and a patriotic king. He conquered Wales and incorporated it in his dominions (1283). He caused himself to be acknowledged as king of Scotland, and when the Scots revolted under their brave leader William Wallace, he invaded Scotland and overthrew them in the battle of Falkirk. He continued the representation of the Commons in Parliament, and when he issued writs for the assembling of that body in 1295 he declared, "It is a most equitable rule that what concerns all should be approved by all, and common danger be repelled by united efforts."

Edward II. (1307-1327). — All that Edward I. had gained in Scotland was lost through the incapacity of his son Edward II. The decisive Scottish victory of Bannockburn (1314) secured the independence of the northern kingdom, leaving the brave native prince Robert Bruce in possession of the throne. Edward's misgovernment at home involved him in a continuous struggle with his vassals. He disregarded the rights of the barons and offended them by the choice of unworthy

favorites. In 1327 he was deposed by Parliament and soon afterwards murdered at Berkeley Castle.

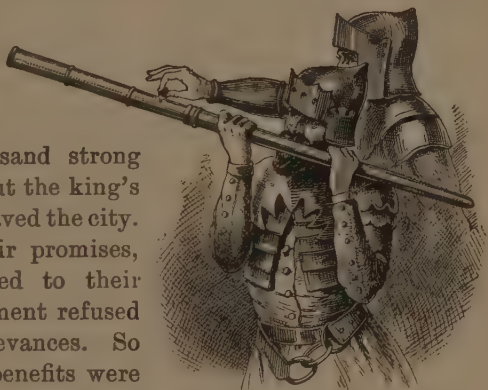

Edward III. (1327-1377). — Edward III. was one of the ablest of England's kings. The first part of the reign was taken up with an attempt to recover Scotland, but the outbreak of the war with France caused a division of the English forces, and Scotland remained free. The war with France, known as the Hundred Years' War, arose from Edward's claim to the French throne. In the early part of the conflict the English were successful, winning the two famous battles of Crécy (1346) and Poi'tiers (1356), and capturing the city of Calais, which remained in English hands for two hundred years. By the treaty of Bretigny' (1360) Edward acquired full sovereignty over his duchy of Aquitaine but renounced his claim to the French throne. Edward's son, the famous Black Prince, was the foremost warrior of the time, but lacked good judgment and prudence as a general. Upon the renewal of the war the English lost most of their conquests.

As a civil ruler Edward had many faults. He was unscrupulous, and not only levied unjust taxes, but allowed them to be collected by dishonest men, so that the royal treasury received only a fraction of the proceeds. Yet he was loved by the common people, especially during the early part of the reign, for he was a patriotic and thoroughly English king. Great credit is due to him for his efforts to promote native industries

Richard II. (1377-1399). — The two chief events of Richard II.'s reign were the revolt of the peasants and that dissension in the royal party which led in a later reign to the ruinous War of the Roses. In the reign of Edward III. the terrible pestilence known as the Black Death had swept over Europe, causing a loss of life which can not be calculated, but which is estimated by some at one third of the population. The effect of this was to cause a scarcity of labor and to raise the price of all the necessities of life. At this time many laborers had purchased their freedom from enforced labor on the estates of

their lords and were working for pay in the manner of our modern wage-earners. The high price of labor due to the hard times was attributed by the nobles to the greed of the workmen, and laws were passed fixing the rate of wages. The landlords tried also to force the laborers back into the position of serfs, for by this means they would secure the labor requisite for the cultivation of their estates. Another grievance of the laborers was the excessive taxation, and especially the imposition of a poll tax, which fell upon a class hitherto exempt. These and other oppressions finally provoked the peasants to revolt. Stirred up by the preaching of the fanatical John Ball, and headed by Wat Tyler, they began a campaign of pillage and murder. A force one hundred thousand strong entered London, but the king's presence of mind saved the city. He made them fair promises, and they dispersed to their homes, but Parliament refused to redress their grievances. So far as immediate benefits were concerned, the revolt amounted to nothing, but it had a wholesome effect on the upper classes, who were thenceforth less tyrannical in their treatment of the peasantry.

As time passed, the king tried to rid himself of all restraint in his government, and for a time succeeded; but his quarrel with Henry, Duke of Lancaster, whom he feared as a possible rival, brought about his ruin. He had banished the duke from England, but while Richard was absent in Ireland, Henry returned, gathered the nobles around him, and obliged the king to abdicate. Thus the direct line of the Plantagenets came to an end.

HAND CANNON, FOURTEENTH CENTURY

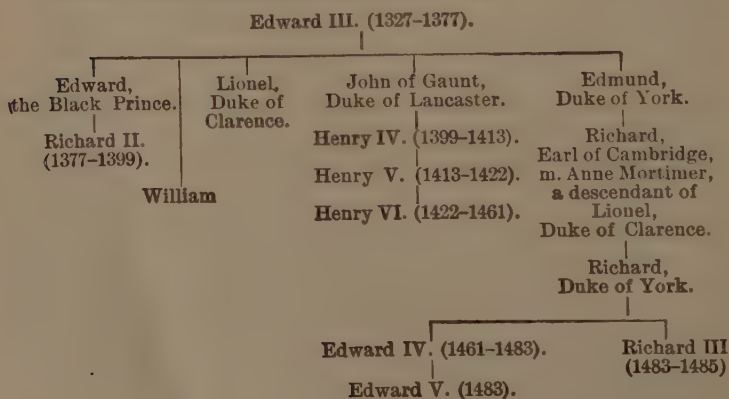

III. THE HOUSES OF LANCASTER AND YORK¹

Dynasties. — When Richard II. abdicated, Henry of Lancaster secured the crown, although he was not the next heir to it. The next two kings also were of the house of Lancaster; but in 1461, as we shall see, the crown passed to the house of York.

Henry IV. (1399–1413). — This king's title had as its basis the consent of Parliament. If it had not been for the support he received from Parliament, the barons, and the clergy, he could never have gained the throne. He had therefore to be careful not to offend those on whose good will his power depended. He tried to make up for a bad title by good government, and he showed himself a skillful and prudent man. He crushed a conspiracy on behalf of Richard, and in the battle of Shrewsbury (1403), where his son, the young prince Hal, distinguished himself, overthrew the insurgent barons. Later he put down a revolt of the Welsh.

Henry V. (1413–1422). — This reign is remarkable for the renewal of the Hundred Years' War. Henry invaded France, and in the battle of Agincourt (1415) won the third great vic-

¹ Descent of the houses of Lancaster and York.

tory of the war. The greater part of France was now in English hands, and by the Treaty of Troyes Henry secured the regency and the promise of the crown for himself and his heir on the death of the French king. But Henry died too soon to gain this object of his ambition, and the next events belong to a later chapter.

John I., 1316.

Philip V., 1316.

Charles IV., 1322.

He was the founder of the Capetian line, which ruled France from 987 to 1328. The feudal system was now at its height, and the king had hardly more power than his great vassals. After the Norman conquest of England in 1066 the Norman duke became a still more powerful rival of the French king, and we have seen in the previous chapter how sharp was the conflict between the French and English monarchs over the latter's possessions in France. The internal condition of France under the Capetian dynasty was generally marked by disorder and lawlessness, but some of the kings were fairly successful in maintaining the royal authority. One of the most vigorous rulers was Philip II., surnamed Augustus.

Philip Augustus of France (1180-1223).—We have seen how Philip II. (Augustus) took part in the Third Crusade, but having quarreled with Richard the Lion-Hearted returned in disgust to France. His reign is more important in the matter of domestic affairs. He was unscrupulous and shrewd, neglecting no means by which his power could be enhanced. He added greatly to the royal demesnes and acquired considerable treasure by confiscating the property of the Jews. On Richard's return from the Third Crusade a war arose between the two kings, but Richard was killed in 1199, and Philip's rival was now the weak and unpatriotic king John, who allowed the English possessions in France to fall, one by one, into the hands of the French monarch. At one time it even seemed as if the crown of England would fall to a French king; for when John broke his oath to the barons, after signing the Great Charter, they offered the crown to Philip's son, Louis, in return for his aid in deposing John. But the death of the latter ruined the cause of the French king. The barons joined against Louis and chose as their king John's son, Henry III.

In the reign of Philip Augustus the war against the Albigenses began. These people, deriving their name from the city of Albi in southern France, held views at variance with the teachings of the church, and in 1208 Innocent III. preached

a crusade against them. The crusade was carried on with cruelty by Philip's nobles, especially by the French count, Simon of Montfort, and a few years after Philip's death the territories of these heretics were incorporated in the kingdom of France. An inquisition to seek out and punish all who had not embraced the orthodox faith completed the destruction of the sect.

Louis IX. of France (1226-1270). — The personal character of Louis IX., who was known as Saint Louis, strengthened the throne by inspiring the veneration of the people. He was a man of great piety and of pure motives. He showed the intolerance of his times in dealing with Jews and heretics, but in general his policy was characterized by mildness. The power of the throne was increased in his reign at the expense of the feudal lords. Reforms were introduced into the judicial system, and the king's courts acquired a higher authority. In relations with foreign nations France gained a position of great importance. Louis's crusading ventures were, as we have seen, unsuccessful, but they bore witness to the piety and bravery of the king. From his time the power of the French monarchy increased until the beginning of the long and disastrous war with England (1337).

Philip IV. of France (1285-1314). — Philip IV., surnamed the Fair, was another able prince of the Capetian line. The means by which he exalted the royal authority were unscrupulous but very effective. To meet the expenses of his army, he resorted to the imposition of burdensome taxes and to extortions from the Jews. His attempt to compel the church to contribute its share to the revenues of the crown involved him in that struggle with Pope Boniface VIII. which, as we have seen, resulted in the humiliation of the latter. This struggle is important as the occasion of the summoning at Paris of the barons, clergy, and representatives of the cities, to sustain the king in his resistance to the papal demands. This was the first meeting of the States-General, a body famous in French history. Philip was sustained by the States-General

in his opposition to the pope, and the papacy now entered on that period of subordination to the French throne which is known as the period of Babylonian captivity. In 1309 the papal see was removed to Avignon on the borders of France.

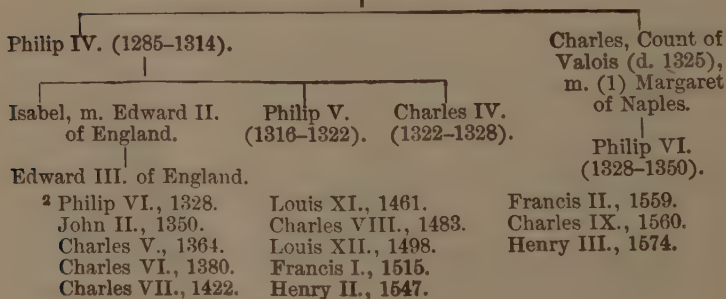

Another important event of the reign was the suppression of the Knights Templars, who were arrested on charges of immorality and impiety and put to death in large numbers. This was an act of gross injustice on Philip's part, but it greatly strengthened the royal power.

The Disputed Succession. — Two years after the death of Philip the Fair a law was passed decreeing that no females should succeed to the throne. In 1328 the direct male line of the Capets became extinct, and the throne was claimed by Philip VI., the cousin of the last king. Edward III. of England, however, disputed this claim on the ground of a more direct descent, his mother being a sister of the last king.¹ The French took their stand on the so-called Salic law, by which the title could not be transmitted through a female. Such was the origin of the Hundred Years' War, which, beginning in 1337, lasted, with several long intervals of peace, down to the year 1453.

The House of Valois. — Philip VI. ascended the throne in 1328. He was the first of the Valois dynasty,² which ruled

¹ Descent of Edward III. and Philip VI.

Philip III. (1270–1285).

France for more than two centuries and a half, that is, from 1328 to the assassination of Henry III. in 1589.

The Hundred Years' War. — We have seen that in the first period of the war, in the reign of Edward III. of England, success was wholly on the English side, that two great victories were won, at Crécy and Poitiers, that Calais was captured by the English, and that in the Treaty of Bretigny (1360), while Edward renounced his claim to the French crown, he retained full sovereignty over the province of Aquitaine. Upon the renewal of the war, however, in the reign of Charles V. (1364–1380), the French were successful. A large part of Aquitaine was reconquered, and the English were driven out of Brittany. At the time of Edward III.'s death in 1377 the French had regained most of the English conquests.

Joan of Arc. — The next period of the war was that in which the brave and skillful English king, Henry V., won the battle of Agincourt (1415), and by the Treaty of Troyes (1420) secured the succession to the French throne on the death of Charles VI. Henry and Charles, however, died in the same year (1422), and Charles VII. was proclaimed king of France, while the son of Henry V., Henry VI., succeeded him on the throne of England. The condition of France seemed hopeless at this time. Almost the entire country was in the hands of the English and their allies. At this crisis France was rescued by Joan of Arc, who, fancying that she was divinely chosen for the mission of freeing her country, secured a commission from the king, joined the French army, and, inspiring the troops with courage, won victory after victory over the English. She had delivered France, but was ill supported by her countrymen, who allowed her to be taken prisoner by the Burgundians. The latter gave her up to the English, by whom, after suffering many insults, she was condemned as a witch and burned at the stake at Rouen, 1431.

The Expulsion of the English. — One thing which had contributed greatly to the English cause was the alliance with the

Duke of Burgundy, the most powerful vassal of the French king, but in 1435 the Burgundians returned to the side of the French monarchy. In the closing period of the war the preponderance of military skill lay with the French, whose general, Dunois, is regarded as one of the greatest military leaders of the age. Charles VII. regained his lost provinces one by one, and by the year 1453 the only important place retained by the English was Calais. Thus the long conflict arising over the English claims on French territory came to an end. Its effect was to render France almost a desert. But though left in a condition of great poverty and distress, she had won her freedom. In the period that followed, feudalism disappeared, the absolute monarchy was established, and France became a strong national state.

CHAPTER XL

GERMANY AND ITALY

The Saxon Line of Emperors. — We have seen that the Carolingian line became extinct in Germany on the death of Louis the Child in 911. The great dukes now chose as king Conrad I. of Franconia, who reigned till 919. He was succeeded by Henry I., surnamed the Fowler, who was the first of the Saxon line of emperors which ruled Germany for over a hundred years (919–1024).

Henry I. (919-936).—This prince was one of the ablest of the German kings. He re-annexed Lorraine to his kingdom, and strengthened his frontiers against outside foes. Of these foes the most dangerous were the Hungarians, whose incursions were a constant menace to his people. In order to withstand their attacks Henry built fortresses throughout the kingdom and placed within them provisions for the support of his troops. Many of the oldest and most famous German towns sprang up around these fortresses. At last the Hungarians came in great numbers, but after a hard struggle Henry put them to rout in the battle of Merseburg in 933. He also conquered the troublesome Slavs on his frontier and held back the still uncivilized Danes.

The Restoration of the Roman Empire (962).—Otto I. (936-973) used with good results the authority which he inherited from his father. He enforced the submission of the great dukes and made himself supreme in Germany. He, too, won victories over the Hungarians and Slavs, and soon caused himself to be regarded as the greatest monarch in Europe. It was his aim to make himself a second Charlemagne and become in reality the emperor of the western world. He interfered in Italy, which had long been in a condition of anarchy, and caused himself to be proclaimed king of the Lombards. In 962 he was crowned emperor by the pope. This event is known as the restoration of the Holy Roman Empire of the German Nation,—an empire which existed in theory rather than in fact, for it comprised hardly more than Germany and Italy; yet it was a deep-rooted belief in the Middle Ages that the old Roman Empire was still standing, and that its rulers were the highest secular representatives of divine power in the world. The effect was bad

THE GERMAN IMPERIAL CROWN
(Now in the Treasury at Vienna)

for Italy and for Germany, since it bound them in an unnatural union, which drew the attention of German rulers away from their domestic affairs and retarded the development of their own country, while it made Italy the scene of frequent wars.

Later Saxon Emperors. — Otto II.'s reign (973-983) was a good illustration of the effects of this new German policy. He neglected German affairs and devoted himself to a vain attempt to make good his claims to all of Italy. Otto III. (983-1002) was consumed by the ambition of building up a great world empire, and throughout his reign he, too, gave most of his attention to Italy. In the reign of Henry II. (1002-1024) the power of the great dukes increased, and Germany was ravaged by internal wars.

The Franconian Line. — With the election of Conrad II. of Franconia in 1024, the Franconian house began to rule Germany. This also lasted for over one hundred years, that is, to 1125. Conrad II. did his best to restore order to his kingdom and repress the power of the nobles. The cities sided with him, but his reign did not last long enough to produce permanent results, and the lawlessness incident to the feudal constitution of Germany still continued. In the reign of Henry III. (1039-1056) an attempt was made to check private warfare by the so-called Truce of God. This forbade the carrying on of private war between sunset on Wednesday and sunrise on Monday, and it did something toward checking the violence of the times. The main events of the reign of Henry IV. (1056-1106) have been outlined in the account of his quarrel with Gregory VII. (Hildebrand),—the so-called War of Investitures. The main interest of the reign of Henry V. (1106-1125) centers in the continuance of this struggle, which came to a pause in the Concordat of Worms (1122), already described. After the short reign of Lothair of Saxony (1125-1137), the German throne was occupied by the Hohenstaufens, one of the strongest dynasties in the history of the empire.

The Hohenstaufen House. — On the death of Lothair, Conrad III. (1137–1152) was chosen. His election angered Henry the Proud, of the house of Welf or Guelph, the strongest of the German princes. The latter's son, Henry the Lion, continued the quarrel, and thus originated the long strife between the Guelphs and Ghibellines, the latter term being an Italian corruption of the name of the native city of the Hohenstaufens. The Guelph faction became in after years the supporters of the popes, so that in the course of time the names Guelphs and Ghibellines lost their old significance and indicated respectively those who stood by the popes and those who upheld the emperors.

Frederick I. (Barbarossa), who ruled from 1152 to 1190, was one of the greatest princes of the Hohenstaufen line. His aim was to restore the empire to its former strength and dignity. He was stern in the repression of private war and made himself a real king in Germany. His quarrels with the pope and with the Italian cities ended, as we have seen, in failure, but this was no fault of his, for he was attempting the impossible. It was too late in the history of the world to bring back the absolute power of the Roman emperors. The German dukes were jealous of his power, and among his enemies at home was Henry the Lion, the most powerful of his vassals. Frederick was obliged in the end to submit to the pope, and to grant virtual independence to the Italian cities. His failure in the third crusade, and his accidental death by drowning while attempting to cross a stream in Asia Minor (1190), have already been described. Henry VI. (1190–1197), though a man of vigorous mind, was equally unsuccessful in his attempt to enforce the imperial authority over Italy; and Otto IV. (1198–1214), when he ventured to break certain pledges which he had made to the pope, and to assert the old imperial power, was deposed by Innocent III.

Frederick II. (1214–1250). — This prince is the most brilliant figure in the history of the later Middle Ages. In many points

his ideas were far in advance of his time. He was well versed in languages and in science, was a skillful diplomat, an able general, and a patron of scholars. Somewhat skeptical in spirit, he cared little for ecclesiastical authority, and his attitude toward heresy and unbelief showed little of the intolerance which characterized the age. Enough has already been said in regard to his expedition to the Holy Land. His success there did not win him the favor of the pope, and on his return the papal and imperial parties engaged in war. During his reign there was the most violent strife between the Guelphs and Ghibellines. Frederick was unable to enforce the imperial authority over the Lombard cities, who were supported by the pope. Affairs in Germany were badly managed, and the country was disturbed by civil war. Frederick made his residence at Palermo in Sicily, which became a center of learning and art. There he gathered about him literary men and scholars from all parts of the world, and so brilliant was the intellectual life of his court, that some would date from his reign the beginning of the great movement known as the Renaissance, or Revival of Learning.

The Interregnum. — Frederick's death in 1250 was followed by a period of confusion known as the interregnum, during which the great vassals of the empire set the imperial authority at defiance and governed or misgoverned about as they pleased. In 1273, however, Rudolph I. was chosen king of Germany. He was a member of the house of Hapsburg, or Austrian line, which is ruling to this day on the Austrian throne. After him came a period during which the emperors were chosen from different houses. Their power was greatly reduced, and Germany was in a condition of anarchy.

The Golden Bull (1356). — One of the most important events of this period was the grant of a charter called the Golden Bull, in the reign of Charles IV. (1347-1378). This fixed definitely the persons who should have the right of electing the emperor. This right was vested in seven electors, namely,

the Archbishops of Mainz, Cologne, and Trèves, the Duke of Saxony, the King of Bohemia, the Margrave of Brandenburg, and the Count Palatine of the Rhine.

Switzerland. — Another important event was the movement for Swiss independence. Switzerland had nominally been a part of the German Empire since 1033. The Hapsburg or Austrian counts claimed jurisdiction over it, but the Swiss were too unruly and liberty-loving to tolerate interference with what they regarded as their rights. Their cities grew in wealth and gained the right of self-government. The mountain cantons, or districts, being remote and inaccessible, were especially independent in spirit. After Rudolph of Hapsburg died, these cantons formed a league to resist the oppression of the Austrians. In their war of independence the Swiss showed great heroism. In 1315, in the battle of Morgarten, they routed a superior force of Austrians, and about seventy years later gained another great victory over the Austrians at Sempach (1386). These battles, followed in 1388 by another victory at Näfels, gained for them their virtual independence.

The Hapsburgs. — From the time of Albert II. (1438) the Hapsburg or Austrian house occupied the imperial throne; for, although the monarchy was elective, the electors always chose a member of this family. The long reign of Frederick III. (1440–1493), the successor of Albert II., marks the transition from the Middle Ages to the beginning of the modern period.

The Normans in Italy. — Early in the eleventh century bands of Norman adventurers began to try their fortunes in southern Italy. There they fought against the Saracens and the Greeks and succeeded in making themselves masters of the province of Apulia. Their most noted chieftains were Robert Guiscard and his brother Roger. In 1059 Robert Guiscard was acknowledged by the pope as duke of Apulia, Calabria, and Sicily. Sicily and a part of Calabria were not yet conquered, but before the close of the eleventh century the Norman power was established in Sicily and southern Italy,

which were united in a single duchy and formed the basis of the kingdom of the Two Sicilies.

The Italian Cities. — That the Italian cities should be able

COSTUME OF A DOGE

successfully to oppose Frederick Barbarossa, the most powerful prince in Christendom, and force him to acknowledge their liberties in the Treaty of Constance (1183), is proof that already in the twelfth century they had reached a position of wealth and power. The most famous of the Italian republics were Venice and Florence. The early importance of Venice arose from her favorable position for commerce. She was already an active trading city at the time of the crusades, and these movements aided her by calling into use her ships for the purpose of transporting the crusaders. Besides the money which she derived

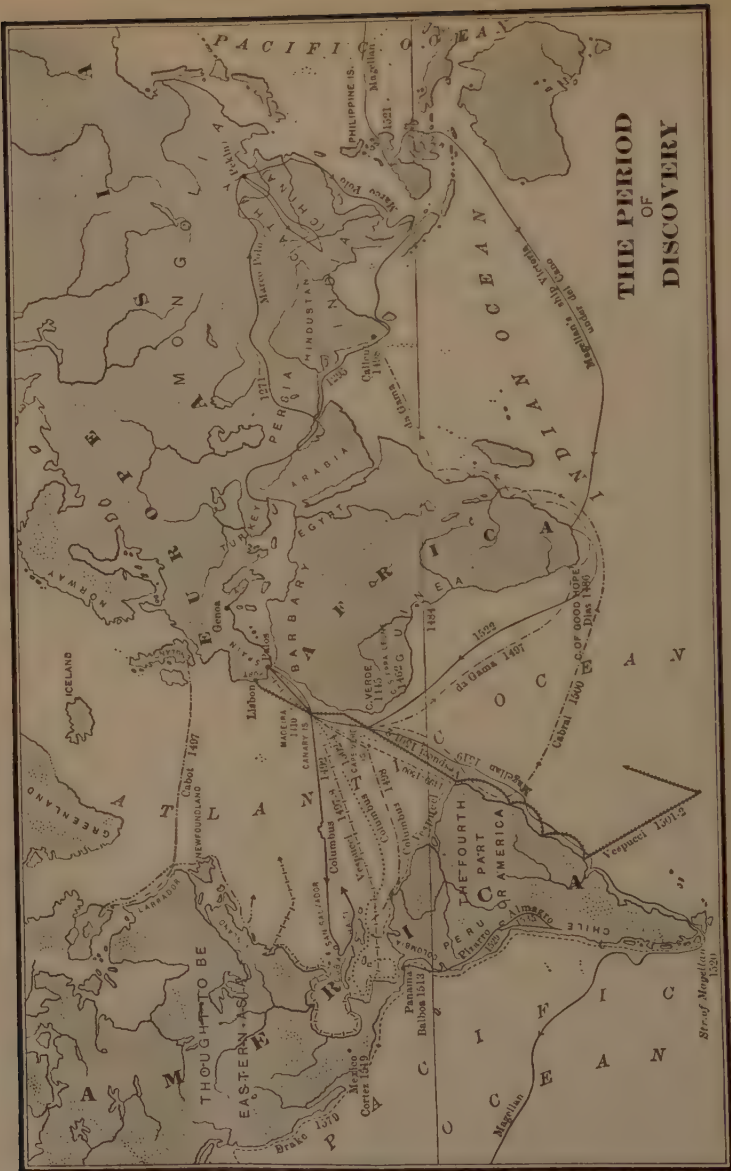

from this transport service, she turned the voyages to good account by bringing back the products of the East. A great Eastern trade developed, especially after the establishment of the Latin empire at Constantinople (1204), of which Venice possessed a large share. She owned land on the eastern coast of the Adriatic, and in the Italian peninsula she extended her sway over a considerable part of Lombardy. Her government was in the hands of a doge or chief magistrate, who with other executive officers was appointed by a great council; but her constitution underwent many changes, and finally she fell under the control of an oligarchy. At the period of her greatest power she took rank as an important European state, with whom the other governments of Europe had to reckon. In the sixteenth century, however, her power began to decline.

Florence was especially distinguished for her manufactures. She became the most important industrial city in Europe. The most brilliant period of her history was the time of the Med'ici family, of whom the most noted members were Cosmo and Lorenzo. The government was republican in form, and both these men were nominally ruling under the constitutional restrictions, but all real power in the state was in their hands. Lorenzo is specially noted for his patronage of art and literature, and many of the masterpieces of Italian art belong to this period.

THE PERIOD
OF
DISCOVERY

MODERN HISTORY

CHAPTER XLI

INTRODUCTION

Beginning of the Modern Period. — Some writers take the year 1453 as the dividing line between the Middle Ages and modern times; others take 1492. The truth is, it is a mistake to assign an exact date for the beginning of modern history, because the transition from the old era to the new was not sudden, but gradual. The date 1453, marking the capture of Constantinople by the Turks, and the overthrow of the empire in the East, is convenient because it is also associated with the emancipation of France from English control, and the revival of learning. The second date, 1492, is associated with that great movement of western discovery which was started successfully by Columbus in that year.

As an aid to memory, we may reckon the new era from either of these dates, yet we must not forget that the more correct dividing line between mediæval and modern times is to be found in the appearance of several features or characteristics in the fifteenth century which were entirely different from anything that existed during the thousand years immediately preceding.

Characteristics of the Transition. — These are, first, the Revival of Learning, or Renaissance, which not only gave a great impulse to the study of literature, art, and science, but, by awakening the activity of men's minds, led to religious doubt, and brought on the great movement called the Protestant Reformation. Second, closely connected with this revival of

learning, was a spirit of enterprise, which showed itself in the most heroic and persistent efforts to discover and colonize new lands. Third, in political matters there was as great a revolution as in matters of learning and commercial enterprise, for on

AN EARLY PRINTING PRESS

the ruins of feudalism, which was characterized by disorganization and the tyranny of petty chiefs, there rose great monarchies, whose rulers were supreme over nobles and peasants alike. This difference is, in fact, so marked that many regard the rise of the absolute monarchy as the peculiar feature of the early modern age.

Rise of Modern Nations.

— It seems strange to us, at first thought, that the liberty of the people should have been advanced by the building-up of despotisms, but in reality it was sup-

planting the despotism of many petty tyrants by the despotism of one man; and the advantage is summed up in the saying of an old writer, "Better the rule of one lion than that of a hundred rats." Moreover, along with the growth of the absolute kingship went the development of the national state. The people of one race became conscious of their common kindred and common aims. A broader patriotism than the love of a city or a little principality arose in their minds, and the way was paved for the formation of the great nations which we see in Europe to-day.

CHAPTER XLII

THE PERIOD OF DISCOVERY

Mediaeval Knowledge of Geography. — During the Middle Ages it was the popular belief that the earth was flat. Scholars knew better, for the theory that the earth is round was held by the ancients and had never been wholly forgotten. Yet educated men even toward the close of the fifteenth century believed it impossible to make any practical use of the fact. There is a familiar story that the learned men of Spain on hearing of Columbus's plan to sail around the world asked contemptuously how people could walk head downwards on the other side of the earth, and how it would be possible for him to climb again the convex surface of the globe. Before the fifteenth century, however, travelers had visited the remote countries of the East. The crusades had greatly stimulated the spirit of discovery, and toward the close of the thirteenth and during the fourteenth centuries extensive explorations were undertaken. Marco Polo, who died in 1324, visited the court of the Emperor of China, and Sir John Mandeville (born about 1300) published a marvelous account of Eastern travel. Another result of the crusades was the opening up of commerce between the Italian cities and the East, and this, too, had added greatly to European knowledge of the geography of the Orient. Goods from India were brought by various overland routes to the Mohammedan countries on the eastern and southern shores

of the Mediterranean, where they were exchanged with the Italian merchants for the products of the West. But the Mohammedans were not always friendly, and toward the end of the fifteenth century almost the only secure route open to the Indian trade lay through Egypt.

Early Portuguese Discoveries. — Surrounded on three sides by the powerful kingdom of Spain, the Portuguese saw the only chance of extending their territory in the establishment of a colonial empire beyond seas. They accordingly began to send out expeditions early in the fifteenth century. In 1410 they discovered the island of Madeira. A few years later the direction of these enterprises was undertaken by the great Don Henry, famous in history as Henry the Navigator, who devoted his whole life to the work. The pope granted him (1432) the right of conquest over all the lands that he should discover. Don Henry died in 1463, but he had seen his Portuguese sailors work their way gradually down the western coast of Africa, each expedition penetrating a little farther than the one before. Cape Verde was passed in 1445, and Sierra Leone was reached in 1462. The impulse that Don Henry had given to discovery continued for many years after his death. The equator was passed in 1471, and in 1486 Bartholomew Dias sailed around the southern point of Africa, and on his return saw the cape which is called the Cape of Good Hope. Thus while other European countries had done little or nothing toward discovery, Portugal had traversed the whole length of the west African coast, reaching a point from which the way was clear to India.

The Discovery of America (1492). — The great motive that actuated the navigators of the fifteenth century was the discovery of an ocean route to India. That done, commerce might take that course instead of passing overland through the countries of hostile infidels bordering the Mediterranean. The Portuguese had sought this route by the east around Africa. Christopher Columbus was the first to seek it by the west.

Columbus. — Columbus was a native of Gen'oa, a city famous

for maritime enterprise. He had pondered the plan of an ocean voyage to India for many years. The Italian Toscanelli, a famous astronomer, had written to him as early as 1474, pointing out the possibility of reaching India by sailing directly westward, and Columbus finally determined on this course. He proposed his plan successively to John II. of Portugal, to the government of Genoa, and to Henry VII. of England, but in each case met with a refusal. He also approached Ferdinand and Isabella of Spain and at first fared no better, for these rulers were then too busy with the war against Grana'da to pay attention to anything else. But when this city had fallen (1492), they were free to listen to him. At last Isabella was won over, she furnished him with three small vessels, the *Niña*, the *Pinta*, and the *Santa Maria*, and appointed him viceroy over all the lands that he should discover.

THE SANTA MARIA

He set sail on August 3, 1492, and sighted land on October 12. It was one of the Bahama islands, and Columbus gave it the name of San Sal'vador. Soon after he discovered the islands of Cuba and Haiti, but did not in this expedition reach the mainland. In a second voyage (1493) he discovered Jamaica and the Lesser Antilles; in a third (1498) he reached the mainland of South America at the mouth of the Orinoco; and in a fourth (1502) he explored the coast of Central America. He was received with the highest honors on his return from the first voyage. After the second he was welcomed with less enthusiasm, for it was expected that he would return with the riches of the East, and he came back empty-handed. The third and fourth voyages brought only disappointment. Columbus died in 1506, neglected by the court, and with none

of his hopes realized. To the end of his life he believed that he had found the eastern coast of India, never dreaming of the existence of an intermediate continent. It was this belief that led him to give the name Indies to the islands that he discovered, and Indians to the inhabitants — names which are still employed. Thus he did not have the honor of giving his name to the New World. The name America was bestowed in honor of Amerigo Vespucci (*Americus Vespucius*), who voyaged to the coast of South America in 1497 or 1499, finding what was first recognized as a New Continent.

North America. — Three races lay claim to the discovery of North America at a date much earlier than the period of which we are writing. These are the Chinese, the Welsh, and the Norsemen, of whom only the last seem now to be generally regarded as having a legitimate title to the honor. At the beginning of the eleventh century Leif Ericson, a Norse sailor, reached the coast of what is now New England, and the Norse gave the name Vinland to the newly discovered land, but further than this we have no positive knowledge of European discovery in America before the fifteenth century. The Norsemen's visit to the New World left no permanent trace, except a vague tradition that somewhere in the western ocean there was a strange, new country — a tradition that possibly influenced later navigators. The first of the fifteenth century voyagers to reach the northern continent of America was John Cabot, a Venetian sailor in the service of England, who discovered the coast near Newfoundland in 1497, while attempting to find his way to China. Between this date and 1501, John Cabot and his son Sebastian, and the Portuguese Corte-real, explored the eastern coast from Salvador to Labrador.

The First Circumnavigation of the Earth. — In 1513, Balboa, a Spaniard, having crossed the Isthmus of Panama, was the first European to catch sight of the Pacific Ocean. It was clear enough now that the continent of America once passed, a water route toward India by the west lay open to the voyager. Magellan, in 1519, undertook the daring enterprise of sailing

around the entire world. Setting out from Spain in that year, he sailed southward along South America, passed through the straits that bear his name (1520), and in March, 1521, reached the Philippines, on the other side of the Pacific. He was killed by the natives, but his followers continued the journey to the Moluccas, and thence by the way of the Cape of Good Hope to Spain, completing the circuit of the globe in a little more than three years. This is justly regarded as one of the greatest feats in the history of maritime enterprise.

Conquest of Mexico. — In the meanwhile Spain had begun to conquer and colonize the New World. In 1519, Hernando Cortez, with some 700 followers, landed in Mexico, and sinking his ships to cut off all hope of retreat, marched into the interior and established himself in the capital city of Mexico. The land was under the rule of the powerful and partially civilized Aztecs, whom Cortez at first overawed, but who soon rebelled, and compelled him to retreat. Cortez was skillful and brave, but unscrupulous and cruel. He forced the natives into an alliance with him, captured Mexico, and assumed the rule of the whole country in the name of the king of Spain. In two years he had added a vast empire to the dominions of Charles V., but that prince was too much taken up with other matters to appreciate what had been done. Cortez was treated coldly after his return to Spain, and died neglected by the court.

Conquest of Peru. — Two other Spanish adventurers, Pizarro and Almagro, conquered Peru (1529–35). Success was easier than in Mexico, for the Incas, the Peruvian rulers, were less vigorous and warlike than the Aztecs. In fact, the Spaniards had less to fear from war with the natives than from their own quarrels over the division of the spoils, of which there was plenty. Almagro was beheaded, and Pizarro assassinated. Fraud and cruelty had marked their conquest, but it was none the less complete. By 1546, the Spanish power was firmly fixed in Peru and in Chile.

Portuguese Colonies. — Spain looking for a western route to India had unexpectedly stumbled on a new continent, which

she soon saw offered better prospects for colonization and trade than the more distant goal she was seeking. Portugal in the meanwhile was still pushing eastward on the route around the Cape of Good Hope. In 1497, eleven years after Bartholomew Dias sighted this cape, Vasco da Gama rounded it with four small ships, passed along the eastern coast of Africa, crossed the Indian Ocean, and landed at Calicut. Discovery was followed by colonization, and a succession of daring and skillful adventurers founded the Portuguese empire in India. Alvares Cabral, who while trying to reach India was blown across the seas to the shores of Brazil, afterwards established in Calicut the first European fort in India. Almeida was the first Portuguese viceroy, but the greatest name of all is that of Albuquerque, who closed up the old routes of the Mohammedans and the Venetians, and gained for his country a monopoly of the Indian trade. He was the real founder of the Portuguese colonial empire in India. By the year 1550 Portugal held all the important points on the Atlantic coast from Lisbon to the Cape of Good Hope, thence along the eastern coast of Africa and the shores of the Indian Ocean to Hindustan—and from there on to the Moluccas.

The Colonies.—Spain and Portugal adopted different methods in dealing with their colonists. Portugal gave the governors absolute power over the colonies, but allowed them only a short term of office. The result of this was misrule and corruption; for each governor, knowing that he had but a short time in which to enrich himself, made use of it by plundering the natives as much as possible. Another characteristic of the Portuguese colonies was that they were merely stations or factories for trade with the natives. There was no attempt to develop the agricultural or mining resources of the country. It naturally resulted that the colonies soon declined, and Portugal, who was the first in the field of discovery and settlement, fell behind the other great colonizing nations.

Spain, on the other hand, did not invest the governors with absolute power, but created different grades of authorities, all

under the Council of the Indies, which was established by Ferdinand in 1511. Moreover, Spain did not confine her colonies to the office of mere markets for the exchange of native goods, but encouraged them to work mines. Spain's colonies accordingly were as a rule more prosperous. Both Spain and Portugal, however, pursued a narrow policy. The colonists were forbidden to cultivate European products on native soil. They were to trade only in what the home country needed, and their trade was monopolized by the home merchants. A few houses in Seville controlled almost the entire trade with the Spanish-American colonies.

Treatment of the Natives.—Along with conquest went missionary work, but it was not an easy task to convert the natives, who naturally were little attracted to the creed of those who conquered and oppressed them. It is told of them that on learning that there were to be Spaniards in heaven they declared they did not wish to go there. The extraordinary zeal and activity of the Jesuits at length made Christianity prevail both in the Spanish and the Portuguese colonies. St. Francis Xavier alone is said to have made 3000 converts. By the middle of the sixteenth century these Jesuit missionaries had penetrated most of the new lands. They taught as well as preached, founding universities at Lima and Mexico, and establishing schools in all parts of the country. All these lands were gained for the Roman Catholic faith, but religion was disgraced by intolerance and persecution. The Inquisition was more active here than in the Old World.

The Spaniards made slaves of the Indians at first. The island of Haiti, then known as Hispaniola, is said to have decreased in population from 1,000,000 in 1492 to 14,000, about twenty years later. This is doubtless an exaggeration, but the evil was so great that the better class of Spaniards finally opposed it. The good Las Casas, a bishop in Mexico, worked steadily for many years to suppress this slave traffic. It was suppressed, but only to give place to another form still worse. What the Indians escaped the Africans were called upon to

suffer. Charles V. gave the monopoly of the African slave trade to one of his favorites, who sold it to the Genoese. Thus began that traffic in negroes which continued almost to our own time.

Effects of the Discoveries.—A very early result of the discoveries was a complete change in the course of European commerce. Instead of being conducted chiefly by land it now took a sea route. As a consequence of this, cities formerly important from their situation on lines of trade now ceased to be so. New trading centers arose, chiefly on the coast. Not only was the course of commerce changed, but new commercial races took the place of the old. The peoples on the Atlantic usurped the position formerly held by the cities on the Mediterranean. The Italians were supplanted by the Portuguese and the Spaniards, and later by the Dutch and the English. There was a vast increase of wealth. A great mass of gold and silver came to Europe from the mines of Peru and Mexico. Money became more plentiful, making it easier for men to carry on trade. A period of great commercial activity now began.

CHAPTER XLIII

THE RISE OF ABSOLUTE MONARCHIES

I. ENGLAND

England in the Fifteenth Century. — After the death of Henry V., whose reign had been marked by good government at home and by such success in France that the French king was reduced to the position of a petty prince in his own dominions, Henry VI., a child only nine months old, succeeded to the throne in 1422.

War of the Roses. — His reign was the very reverse of his predecessor's. France, under the leadership of Joan of Arc, freed herself from the English rule. Jack Cade led a revolt of the peasants, which, though soon put down, caused much bloodshed and loss of property. Worse than this, the country was torn by civil war; for the weakness of the king incited the attacks of the nobles, who found a good occasion in the claims of Richard, duke of York, to the throne. His claim rested on the ground that he was the descendant of Lionel, the third son of Edward III., while Henry VI. descended from John of Gaunt, the fourth son of Edward. In the first battle of St. Albans (1455) the Duke of York was victorious, and, the king being seized with a fit of insanity, York became Protector. He did not long retain his power, however; for Queen Margaret refused to submit, and won the battle of Wakefield (1460), in which York was killed. The latter's claim descended to his son Edward, who won the battle of Mortimer's Cross, and though the Yorkists were afterwards defeated at St. Albans, he routed the Queen's forces at Towton, and was crowned king.

In these changes of fortune the Earl of Warwick, called the 'king maker,' had played an important part. He was by far the most powerful of the barons, having, it is said, over 30,000 retainers. It was through his aid that Edward came

to the throne; and, thinking that he would succeed as well in pulling down as in setting up a king, Warwick, who was dissatisfied with Edward's government, rose against him in 1470. At first he was successful. Edward IV. was driven out, and Henry VI. restored. But Edward returned in the following spring, defeated and killed Warwick at Barnet, won another battle at Tewkesbury, and threw Henry VI. into the Tower, where he was soon afterwards murdered.

THE TOWER OF LONDON

Such was the War of the Roses, so called from the badges worn by the opposing parties,—that of the Lancastrians, or King Henry's party, being a red rose, and that of the Yorkists, a white one.

Effect of the War.—Strange to say, this civil war did comparatively little damage to the general population. Trade and industry went on as usual. The chief sufferers were the nobles and their retainers. The result was that, while the peasantry and the artisan class were left to prosper in peace, the nobles were greatly diminished in numbers, and broken in fortune. Thus there was a chance for a strong ruler to govern in a more despotic way than ever before, for hitherto the main

restraint upon the king's power had been exerted by his great vassals. So it happened that the foundation of an absolute monarchy in England was laid in the years immediately following the War of the Roses.

Edward IV. (1461-1483).—Edward IV. found little opposition from his Parliament, and ruled as an absolute king. His reign almost exactly coincides with that of Louis XI., who in the same way was laying the foundation of an absolute monarchy in France. Edward was not a wise or far-seeing ruler. He was self-indulgent and a spendthrift. His project for seizing part of the French king's territory, through an alliance with the Duke of Burgundy, was a failure, and in his home government he did nothing to gain for himself the favor of his subjects. He died in 1483, leaving the throne to his son Edward V., a boy of twelve years; but the young king soon fell into the hands of his uncle Richard, Duke of Gloucester, who put him with his brother into the Tower, and became Protector. The murder of the young princes in the Tower—a crime of which Richard was suspected, and which has since been fastened upon him—removed all obstacles to his becoming king. In 1483 he was crowned as Richard III.

Richard III. (1483-1485).—This king is described as a monster of cruelty, as hideous in appearance as he was base in character; but these accounts are probably the exaggerations of his enemies. He was a man of marked ability, and, for the day, of unusual cultivation. Before he came to the throne he had shown himself a patron of learning. But the unscrupulous means he used to make himself king raised up many enemies, who stood in the way of his establishment of a strong government. The Duke of Richmond saw a chance in the unpopularity of the reigning king for the success of his own claims to the throne. He, too, was a descendant of John of Gaunt through the female line, which had married into the family of Tudor. He landed in England in 1485, and in the same year defeated and killed Richard III. in the battle of Bosworth.

Henry VII. (1485-1509). — Henry Tudor, who ascended the throne under the title of Henry VII., was of the house of Lancaster, but his marriage with Elizabeth of York, eldest daughter of Edward IV., united the two rival families and closed the long period of dynastic strife. The date of his accession is taken as the beginning of the modern period of English history. It also marks the beginning of the period of the absolute monarchy. Parliament met but once in the last thirteen years of Henry's reign, and the Tudor monarchs generally found little restraint on their power. Henry's method of building up the power of the throne was by the accumulation of wealth through fines, forced loans, and other unjust means, until he was able to rule independently of Parliament and to bequeath to his successor a greater treasure than any English king had before possessed. He seems to have been completely ruled by the passion of

CROSSBOWMAN
(Fifteenth Century)

avarice. With him ambition took this form, and he cared little for national aggrandizement unless it could be made the means of getting money for himself. When insulted or aggrieved, he continued to make a profit from his wrongs by exacting a money payment. When Charles VIII. of France wished to annex Brittany to France, Henry allowed him to do so in return for a substantial indemnity, but not before he had made Parliament vote him supplies on the pretense of war. Thus he made his enemies pay for peace and his friends for war.

At home, Empson, Dudley, and Morton, the notorious instruments of the king's greed, devised all manner of schemes for enriching their master. Obsolete laws with excessive

penalties were revived and enforced against those who had the means to pay the enormous fines. If a man lived on an expensive scale, he was taxed heavily on account of his evident wealth. If he lived meanly, he was taxed heavily on the ground that he was hoarding his treasure. The nobles, whose numbers had been greatly reduced by the War of the Roses, were repressed by various means, such as the law forbidding them to keep armed retainers, and the king's will was enforced by the arbitrary rulings of the court of Star Chamber, which became a most effective instrument of tyranny. By such unscrupulous but well-devised means the king made his will absolute.

In many respects, however, he was a wise and discerning ruler, a thorough master of kingcraft, and his many vices left the kingdom at peace. The nobles, not the people, were the chief sufferers from his tyranny.

II. FRANCE

Charles VII. — The successful issue of the Hundred Years' War was not due to the king, but to the heroism of Joan of Arc, the military genius of Dunois, and above all to the people of France, who, feeling conscious of their nationality, had risen with one accord to drive out the foreigner. Charles was indolent and suspicious, and showed no ability as a ruler. The old nobility had almost disappeared at the close of the war, but the authority of the king was endangered by the rising power of several great houses related to the royal family. Of these the Burgundian dukes were the most important. The duchy of Burgundy on the east, whose ambitious rulers were constantly trying to extend its boundaries, threatened to become a rival of France as a European power.

Louis XI. (1461-1483). — On the death of Charles VII. in 1461, the task of unifying France and making royalty supreme fell to the lot of one of the ablest but most unprincipled kings that ever occupied the throne. Louis XI. was a cunning, far-sighted statesman, ready for any means, however foul, that

would serve his purpose of exalting the royal power. He preferred to outwit his enemies rather than to fight them, but when fighting had to be done, he showed no lack of bravery or capacity. He held no promise binding, and gained his ends, wherever possible, by stealth, treachery, and deceit. On the other hand, many of his foes showed the same qualities, coupled with less ability, and the ends for which they were working were far worse for France, which, if they had had their way, would have remained weak and disunited.

Louis XI. and the Nobles. — His efforts to subdue the great lords led to the combination against him known as the League of the Common Weal. Louis was at first unsuccessful, but when peace returned he stirred up strife among his enemies, and by buying off one, while he plundered another, added greatly to the royal demesnes.

A FRENCH NOBLE OF THE
FIFTEENTH CENTURY

Charles the Bold of Burgundy. — This ambitious but hot-headed prince soon came into conflict with Louis, at whose expense he was trying to extend the boundaries of his duchy. At one time it seemed as if Louis' cause were lost; for, falling into the power of Charles, he was kept a prisoner until he had agreed to everything that the latter wished. But he afterwards repudiated the treaty, and finally forced the duke to accept more favorable terms. Charles now tried to

extend his frontier eastward, with the design of building up a great European state with its capital at Nancy, but in this he had to reckon with the valor and independent spirit of the Swiss. In the battles of Granson (1476) and Morat (1477) the duke's forces were repulsed, and in another battle near Nancy, he was defeated and killed. By his death the most serious danger to the power of the French monarchy was removed.

Louis' Successes. — After the death of Charles the Bold a large part of his dominions were seized by Louis and incorporated with France. Louis also gained Roussillon, Anjou, Maine, and Provence, and the territory of France was rounded out to the Pyrenees and the Mediterranean. Besides adding to his territories he strengthened his kingdom by centralizing the administration and improving the internal government. Despite the vices of his character, he did a good work for France, giving her a more stable and a better government. Feudalism was overthrown, and the period of the absolute monarchy began.

III. SPAIN

Spain under the Moors. — Throughout the Middle Ages the Moors, who, as we have seen, destroyed the Visigothic kingdom in 711 A.D., were the dominant power in Spain. The Christians, however, retained a part of northern Spain, and in that region arose several little kingdoms, which kept up a steady resistance against the Moors, and finally began to make head against them. Of these little Christian states the chief were Castile, Leon, Aragon, and Navarre. Castile and Aragon were the most powerful of the four states, and they constantly extended their boundaries at the expense of their neighbors and of the Moors. As the latter declined, the Christian states gained in power, but all the defects of feudalism

INTERIOR OF THE ALCAZAR, SEVILLE

existed in their constitution. During the Middle Ages Spain was not only under a divided rule, but each of the Christian kingdoms was weakened by the lack of a central authority, the kingly name being held in small respect.

Ferdinand and Isabella. — The beginning of the modern kingdom of Spain dates from the marriage of Ferdinand of Aragon and Isabella of Castile and Leon in 1469; but they ruled their respective kingdoms independently, and the formal union of the two states was not effected till later. It was the object of both sovereigns to reduce the power of the nobles and render themselves absolute. In carrying out this purpose Ferdinand was especially skillful. He allied himself with the cities and strengthened the Holy Brotherhood, a military force maintained by them, thus gaining a powerful weapon to be used against the nobles. The latter were stripped of many of their privileges. Allying himself with the Holy See he used all the power of church and state to maintain the royal authority. In his reign the Inquisition was introduced in Spain. It was an extraordinary tribunal, established for the purpose of crushing out heresy and infidelity, and was employed against the Jews and the Mohammedans with deadly effect. Thousands of unbelievers were put to death. But the Inquisition served another purpose as well. It was used by Ferdinand to bring both the clergy and nobles into complete submission to his will.

The most famous event in the reign of Ferdinand and Isabella was the discovery of America, described in another chapter. In the same year that Columbus started on his first voyage (1492), Granada, the last stronghold of the Moors in the peninsula, was captured by the Spanish sovereigns, and from that time a cruel persecution of the conquered race continued, until no Mohammedans were left in Spain. Ferdinand died in 1516, having fully accomplished his purpose of building up an absolute monarchy in Spain. In the period that followed Spain was the leading nation in Europe.

 CHAPTER XLIV

THE EMPEROR CHARLES V. (1519–1556)

The Dominions of Charles V. — Charles V. ruled over wider dominions than any European sovereign since Charlemagne. He belonged to the famous house of Hapsburg, from which he inherited Austria. It is said of Austria that, while other nations extended their power by conquest, it was her good fortune to gain territory by politic marriages. This is well illustrated by the inheritances of Charles V. On his father's side his grandmother was the heiress of Burgundy and the Netherlands, and his grandfather was the emperor Maximilian; the mother of Charles V. was the daughter of Ferdinand and Isabella of Spain. Besides Austria, Charles possessed Spain, the kingdom of Naples, the Netherlands, and their dependencies, together with the vast regions newly discovered in America. All these lands he held by right of inheritance. To these Germany was added by his election to the imperial throne.

The Imperial Crown of Germany. — This honor of wearing the crown of Charlemagne was coveted by other sovereigns.

Henry VIII. of England and Francis I. of France were rival candidates; and the choice of Charles never ceased to be a cause of envy and hatred to the latter of these kings. It was one cause of the long and disastrous wars between Francis and Charles. Nor did it add as much to the emperor's power as might be supposed, for the German princes were a jealous and unruly set of vassals; and, worse than that, Germany was soon to be convulsed by religious strife; for in the same year that Charles V. was crowned emperor, Martin Luther publicly burned a papal bull at Wittenberg, and defied the Roman Catholic Church.

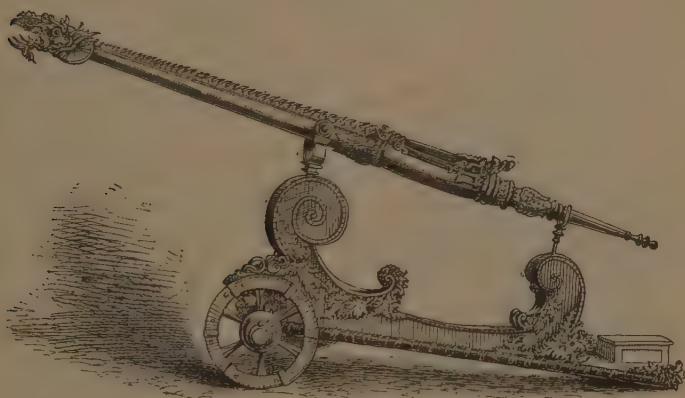

First War with Francis I. (1521-1525). — Francis had other reasons for wishing to humble the emperor than disappointment over his failure to obtain the imperial crown. In the first place, he had a good political reason, for he feared that Charles aimed to become a second Charlemagne, and extend his power over all Europe. In the second place, the French king wished to retain Milan, which the emperor claimed; and at the same time the latter also claimed Burgundy, which had been seized by Louis XI., and was still kept by Francis.

Francis was unfortunate from the first. He offended Henry VIII., who accordingly joined the emperor against him. His agents in Italy governed so badly that the Italians also turned against him. Milan was lost to France. Finally, the strongest of his vassals, the constable of Bourbon, betrayed him and went over to Charles.

Invasion of Italy. — Francis, thinking that if he commanded in person all might be regained, invaded Italy, recaptured Milan, and laid siege to the city of Pavia. Before reaching the walls of that city, he detached a considerable force from his army to march against Naples. With his reduced numbers, he was no match for the Spaniards, who made a rush from the town, scattered his troops, and took him prisoner, after he had killed seven of his enemies with his own hand. The battle of Pavia (1525) decided the war. Francis wrote back to his mother, it is said, that all was lost save honor.

Treaty of Madrid. — He lost that, too, a little later; for, having signed a treaty granting advantageous terms to Charles, he broke it as soon as he regained his liberty. This was the Treaty of Madrid, by which Francis gave up his claim to Burgundy and Naples, and made other important concessions to Charles. He signed it when the latter's prisoner, — a fact which in part excuses his refusal to abide by it.

Second War with Francis (1526–1529). — Francis had no intention of observing the Treaty of Madrid. The deputies of,

DOUBLE-BARRELED 'DRAGONNEAU'

(Cast in 1508 in Madrid)

Burgundy, moreover, reminded him on his return to France that he had sworn to protect that province, and, therefore, that he had no right to give it up to Charles.

Sack of Rome. — Italy found her new rulers harsher even than the French, and accordingly prepared to fight on the side of Francis, who was also aided by the pope, Henry VIII., and the Swiss; so the advantage seemed at first to be with him. Early in the war, the traitor Bourbon allied himself with the Lutherans, and captured Rome. He was killed in the assault; but his troops pillaged the city, showing all the

cruelty and ruthlessness that had marked the sack of Rome by the Vandals and the Goths. A powerful French army then invaded Italy, but accomplished nothing permanent. Genoa went over to the side of the emperor, who came to Italy in person, and reasserted his authority in the peninsula.

Treaty of Cambrai. — The war was closed by the Treaty of Cambrai, by which France retained Burgundy, but gave up all claims to Italian lands. Thenceforth a great part of Italy remained under the power of the house of Austria (except for the period of Napoleon's supremacy) till 1859, when the war of Italian independence resulted in the expulsion of the foreigners.

Alliance with the Turks. — At the close of his second war with Charles, Francis began to seek new allies, in the hope of regaining what he had lost by the Treaty of Cambrai. From Henry VIII. he could obtain no aid; for that prince preferred to play the part of a neutral, and desired the complete success of neither of the two rivals. So Francis was driven, as a last resort, to an alliance with the celebrated Soliman I., Sultan of the Ottoman Turks, thus horrifying all Europe by joining with the infidels.

Soliman the Magnificent. — Soliman I. was the greatest ruler of the Turks since the days of Mohammed II., who had planted the crescent in Europe by the capture of Constantinople, in 1453. His reign has been called the Golden Age of the Turkish race, for up to his time they were merely barbarians, with whom the Christians had nothing to do. Under Soliman they took a place among European peoples. For many years before Francis concluded his treaty with Soliman (1534), the latter had kept eastern Europe in constant terror from his attacks. In 1522, at the head of 150,000 men, he had taken Rhodes, and four years later he had won the great victory of Mohacs in Hungary.

All Hungary was in his power, and he was marching on Vienna, the Austrian capital, at the very moment when the Treaty of Cambrai was being signed. It was Charles' dread

of this new enemy that saved Francis from a still greater humiliation than that which he suffered in the terms of this treaty. It was this same fear that influenced the emperor to forgive the Protestants and consent to the religious peace of Nuremberg, in which the Lutherans and Catholics forgot their differences for the moment, in order to repel the common foe of Christianity.

Charles V. and the Turks. — With all Germany united against him, Soliman dared not continue his invasion, and returned to Constantinople immediately. Charles then turned his attention to the sultan's piratical subjects, whose headquarters were at Tunis. These marauders had long been the pest of the Mediterranean. The coasts of Italy and Spain were never for a minute safe from their attacks, which always resulted in plunder and murder, and generally in the capture of Christian prisoners, who were taken to the Barbary coast to be held as slaves by the Moslems. In 1535 Charles sent an expedition against Tunis. His success was complete, and he is said to have set free 20,000 Christian captives.

CHARLES V.

Alliance with the Lutherans. — Francis not only allied himself with the Turks, but committed another crime in the eyes of orthodox Europe by aiding the Lutherans in Germany. Thus while Charles V. could pose as the defender of the cross, Francis appeared as the friend of heretics and infidels. He tried to justify himself by saying that "when the wolves rushed upon his flock, it was surely his right to set the dogs upon them."

Third War between Francis and Charles (1536-1538). — War broke out in 1536. Francis at the first blow gained Savoy and

Piedmont, and was thus master of the approach to Italy; but he let himself be duped by the false promises of Charles, and by entering upon negotiations allowed his enemy to gain time. Charles unexpectedly attacked Piedmont, captured its strongholds, and appeared in southern France at the head of 60,000 men. It seemed for the moment as if all France would be conquered in one campaign; but by the French king's orders the country through which the Spaniards passed was made a desert. The imperialists suffered from want and from the constant attacks of the peasantry, and were at last forced to withdraw. In the next campaign France had somewhat better success; but the war closed with the truce of Nice (1538), without a decisive gain for either party. Each prince kept what he had conquered.

Revolt of Ghent. — For a short time after the war, Francis and Charles were on very amicable terms. The great city of Ghent in the Netherlands had revolted against its Spanish rulers, and offered to acknowledge Francis as its sovereign. Charles thought it politic to make friends with the French king in this emergency; so he held out hopes that Milan would be given to Francis, who coveted Italian territory more than anything else. Francis not only refused to listen to the citizens of Ghent, but granted the emperor the privilege of passing through France for the express purpose of punishing the rebellious city. Charles soon had Ghent at his mercy. He made its proud burghers bow before him with halters around their necks, and fastened his tyrannical rule on the city more firmly than ever. This object gained, he had no scruples about refusing Milan to Francis.

Fourth War between Francis and Charles (1542-1544). — The fourth war between these two quarrelsome monarchs was marked by one brilliant victory for the French, but was indecisive in its results. At Cerisoles the young Duke d'Enghien, who was under orders not to risk a battle, was keeping watch of the Spaniards. Tired of acting on the defensive, he begged the king to let him fight. The king finally consented, and the

young commander won the most brilliant victory which France had gained for many years. The Spaniards are said to have lost 12,000 men; the French, only 200. But Francis did not follow up this advantage. In another quarter, France was attacked by Henry VIII.; in still another by the emperor himself. Charles, however, was in danger from the Protestants at home. This fact, and the failure of the English to coöperate with him, made him willing to come to terms; and the war ended with the Treaty of Crespy (1544), which left matters about as they were at the outbreak of the first war.

Charles V. and the Protestants. — Three years after the Treaty of Crespy, Francis I. died, and Charles, free from the rivalry of the French king, was able to give his attention to the Protestants. In 1547 he began the first of his wars with the Smalkaldic League. The general results of these wars will be given in a succeeding chapter; but it is necessary here to speak more particularly of their causes and their chief events.

The Council of Trent met in 1545 to decide upon the merits of the Protestant movement; but the Protestants of Germany refused to recognize its authority, because it was held in a foreign country and presided over by the pope. Luther, who had often worked in the interest of peace, died in 1546, and there was nothing to prevent the passions of the two parties from finding an outlet in war.

The leaders of the league were Philip, Landgrave of Hesse, and John Frederick, Elector of Saxony, — men of totally opposite characters. Philip was inclined to aggressive measures; while John Frederick, though sincere and upright, trusted too much to an overruling Providence which should defend the right. He lacked energy in his own defense. So the league was weakened by dissension among its leaders. Duke Maurice of Saxony deserted to the emperor; for, though a Protestant, he is said to have coveted the estates of John Frederick, and to have received from the emperor the promise of the electorate as the price of his services.

The general of the league, though an able man, was ham-

pered in every way by conflicting orders. After some slight success, he was recalled; and Charles, who had found time to reinforce his army with troops from Italy and from the Netherlands, reduced the cities of the league, and finally defeated and captured the elector in the battle of Mühlberg (1547). This success seems to have turned the emperor's head. He treated the captive John Frederick so harshly that he provoked a reaction. He also banished many Protestants, and caused much discontent by keeping his Spanish troops in Germany. Moreover, he offended his ally, Maurice of Saxony, who found himself ill rewarded for his treason.

The Last Years of Charles V.'s Reign. — For a short time after the first war with the Protestant princes, Charles seemed to be at the height of his power; but the French king, Henry II., saw a danger to France in the growing strength of the emperor. Maurice of Saxony and other Protestant princes secretly allied themselves with Henry. The second Smalkaldic war followed, and resulted almost instantly in the humiliation of Charles, who barely escaped capture by fleeing through the mountains to Switzerland. He soon afterwards attacked France, but with slight success. In 1555 he was obliged to agree to the Religious Peace of Augsburg, recognizing under certain limitations the rights of Protestantism. Thus every one of his plans had failed of fulfillment. He had not crushed France, or made himself absolute in Germany, or uprooted Protestantism. Thoroughly discouraged, he abdicated his throne in 1556, and retired to the monastery of San Yuste. There he is said to have passed his time in making clocks and mechanical toys, and, as his death grew near, to have indulged in the gloomy pastime of rehearsing his own funeral. He died in 1558.

Character of Charles V. — At the outset of his reign no prince ever had better prospects. With the resources of half of Europe at his command, it seemed inevitable that he would make himself the ruler of the Western world. His failure was due in part to defects of character. He did not lack ability either in military matters or in the direction of state policy; but he was ut-

terly unable to understand the real nature of the time in which he lived. He underestimated the strength of the Protestant movement. He himself was a bigot, and he believed that the exertion of a little force would bind men's consciences to the old faith. In his political schemes he was thoroughly selfish. He had no regard for the spirit of nationality, and seized what lands he could, without consideration for the wishes of the inhabitants. It was too late for a universal monarchy, and any attempt to unite all Europe under the rule of one man was doomed to failure.

CHAPTER XLV

THE PERIOD OF THE REFORMATION

Summary of Periods. — It has already been said that the early part of modern history, that is, from the year 1492 to the year 1648, was a period of religious revolt. Before the sixteenth century had advanced many years, the movement known as the Reformation arose in Germany, and from that time down to the middle of the seventeenth century the main interest of European peoples was in religious questions. We may therefore term this entire period the period of the Protestant revolution, or the Period of the Reformation. First came the origin of the new movement and its struggle against great odds; then came many years of warfare involving the great powers of Europe. In 1648, by the Treaty of Westphalia, all the nations of Europe reached a compromise in these religious disputes, and the succeeding period takes on a new character.

The years following 1648 were marked less by religious quarrels than by political rivalries. European states fell to disputing about territories and political claims, and within the states themselves the different social classes were carrying on a struggle over political privileges. We can therefore conveniently term this later period of modern history, — from the middle of the seventeenth century to the present time, — the Period of the Growth of Nations.

Character of the Reformation. — The Reformation was a revolt against the power of the Roman Catholic Church. Men felt that the exercise of that power was an interference with their national and local rights. Along with hostility to the outward power of the Roman Church there grew up a feeling of distrust in the spiritual teachings of the Church in many important points. The reformers, therefore, aimed not only to rid themselves of government from Rome, but to establish a faith

which should be purer and more orthodox than that which was then accepted.

Causes of the Reformation. — The revival of learning in Europe set men to thinking along many unaccustomed lines. It had opened new sources of information, as well as stimulated inquiry. In many departments of human thought men had discarded authorities and revised their own opinions. They came to trust in their private judgment, and to investigate for themselves many matters which had hitherto been unquestioningly accepted. It was natural that they should apply the same methods to religious matters and come to opinions at variance with those hitherto held and still maintained by conservative minds.

The Church at this time was thought by many to be corrupt in its administration of affairs. There were loud complaints against extortions by church officers, and other abuses. There had been such complaints before, but anything like a revolt against the authority of the Church had been quickly put down, and in many instances abuses had been removed by reformation within the Church itself. The new movement, however, was destined to become too powerful to be put down, and its leaders soon passed beyond the point at which they were willing to reform the Church from within. Finding that the Church would not respond as quickly and as fully to their demands as they wished, they left the Church and attacked it from without.

CHAPTER XLVI

THE REFORMATION IN GERMANY

Immediate Causes of the Movement. — When the Reformation first appeared in Germany, there had long been discontent with the administration of Church affairs. The immediate occasion of the movement was the sale of indulgences by a Dominican monk named Tetzel. In the early Church indulgences were remissions of penances imposed on people who were guilty of

LUTHER

mortal sins. It was always understood that a man must first have shown true penitence, but this being so, the Church exercised the power of remitting the temporal punishment for his sins. The custom arose of accepting the payment of money instead of subjecting the penitent to some other form of penance. Tetzel and his agents are said to have dispensed these indulgences in Germany in such a manner as to cause scandal among the better classes. The conduct of Tetzel and his associates gave great offense to the friends, as well as the foes, of the Church, and the general discontent soon found a vigorous spokes-

man in an Augustinian monk named Martin Luther.

Martin Luther. — Martin Luther was born at Eis'leben in 1483. He was the son of a poor miner, had entered the Augustinian order, and had become professor of theology at Wittenberg. In the course of his studies he had come to question the practice of the Church in regard to the whole system of penance. Up to this time, however, he had made no open

protest, but Tetzel's course in Germany impelled him to public opposition. In 1517 he nailed to the church door at Wittenberg ninety-five theses or propositions, appealing to men's consciences against the practice of "selling forgiveness."

The widespread discontent in Germany gave to these theses an instant publicity. They were printed and scattered broadcast throughout the country. In them Luther showed no intention to break with the authority of the Roman Catholic Church. They were merely propositions for dispute, and he nailed them on the church door as a challenge to any disputant who might be willing to argue against them. Disputants soon appeared, and the first thing they did was to appeal to the authority of the Church. This led Luther, at first, to question and finally to deny the authority of the Church, as resting not on a divine but on a human basis. He said that the Church was not the source of divine truth, and that the Bible was the sole source. The Reformation now entered on its first phase.

Luther and the Pope.—Pope Leo X. tried at first to bring Luther to terms by peaceful measures. He sent his legate, an Italian scholar named Caj'etan, to demand his obedience, but failed to win him over. Luther had a firm friend in Frederick the Wise, the Elector of Saxony, who, though he often opposed Luther's imprudence, did not fail to protect him in the hour of need. Another friend of Luther's, and a very keen and learned ally in his religious warfare, was Philip Melanch'thon, who was a professor of Greek at Wittenberg.

After the failure of a second attempt to make Luther retract, a public disputation was held at Leipzig. Here the Catholic champion was Dr. Eck, a very able and keen-witted defender of the papacy. Luther found himself forced to take a more decided stand in regard to the primacy of the Roman bishop. In the course of the debate he came out openly as a disbeliever in the divine authority of the pope, and he declared that some of the views of John Huss, who had been burned at the stake as a heretic, were orthodox. Luther soon issued an appeal to the nobles of Germany against the Roman clergy and

against the interference of the Church in temporal affairs. In 1520 the pope issued a bull condemning Luther's writings and ordering him to recant in sixty days on pain of excommunication. Luther's only answer to this was the public burning of the bull in the presence of a throng of students at the gates of Wittenberg. By this act he virtually declared open war on the Church.

The Diet of Worms (1521). — Charles V. had now come to the imperial throne, attaining thereby the position of the most powerful sovereign in Europe. The first great step that he had to take was to decide between the pope and Luther. Accordingly, on his arrival in Germany in 1521, he met the imperial diet at Worms and summoned there Luther under a safe-conduct. Luther was called upon to recant, but refused to do so unless he could be shown that his opinions were contrary to the teachings of the Bible. His attitude was courageous and his refusal to retract caused great indignation on the part of the emperor and the friends of the Church; but he was allowed to return in safety.

Luther at the Wartburg. — After he had left the diet, an edict of outlawry was passed against him. This classed him as a heretic, thereby forbidding anybody to shelter him. On Luther's journey home the Elector of Saxony, fearing for his safety, had him conveyed to the castle of Wartburg. While there Luther busied himself with the translation of the Bible into German, giving to his version a vigor and pithiness of style which has made it a classic of German literature.

Wars. — Luther left the castle of Wartburg to quiet a disturbance in Wittenberg, where a friend of Luther named Carlstadt was trying to give to the reform movement a radical and violent character. He and his followers aimed at sweeping away the entire ecclesiastical system. Luther's persuasions were effective and the movement was checked, but other radical and zealous leaders had been busy in stirring up the peasantry, and in 1524 the great Peasants' Revolt broke out.

The rebellion failed completely and its authors were punished with great cruelty. Luther, though sympathizing with the wrongs of the peasants, was wholly opposed to the revolt and took the side of the authorities.

This was not the only war in the ten years that followed the Diet of Worms. The first and second wars between Francis and Charles V. took place during this interval. This fact is important as showing why the emperor was not free to give his full attention to the crushing out of the reform movement in Germany.

THE WARTBURG

Progress of the Reformation. — During this time the reformers made considerable progress. Under Adrian VI., who succeeded Pope Leo X., there seemed for a moment the chance of a reconciliation, for he was disposed to pay some regard to the complaints against ecclesiastical abuses in Germany. Clement VII., however, who came to the papal throne in 1523, was less inclined to yield to these demands.

Protestants. — The lack of a strong central rule in Germany was most favorable to the new cause. Had the emperor been able to carry everything as he wished, there is no doubt that he would have destroyed the reform party in its infancy, but the princes of Germany were jealous of him and of each other, and some of them were friends of Luther more from policy than from religious conviction. These powerful friends of his were so numerous that for several years a majority could not be found against him in the imperial diets.

At the second Diet of Spires, however, in 1529, an edict was passed which forbade the progress of the reform in all the states that had not yet accepted it. To the reformers this seemed most unjust; for the old faith was free to go anywhere. Accordingly the Elector of Saxony and several other German princes, as well as fourteen of the cities, signed a protest, and from this fact the reformers were called Protestants. At another diet which was called at Augsburg in the following year the Protestant confession of faith was read. This is known as the Augsburg Confession, and contained all the essential doctrines of Protestantism.

Luther and the Swiss Reformers. — At the very time when it seemed most necessary that Protestants should be everywhere united against their common foes, there occurred a serious breach between two important branches of the Protestant Church. The new movement had already made considerable progress in Switzerland, but it there took on a somewhat different character from that which it bore in Germany. The leader of the Swiss Reformation, Zwingli, took a different view from Luther on the subject of the Lord's Supper and some other points in doctrine, but he himself was not intolerant, and it seemed probable that the two bodies might be united. For this purpose a meeting was arranged at Marburg in 1529. There efforts were made by the friends of peace in both parties to reach a compromise. Luther, however, refused to recognize the Swiss reformers as in the same communion, and, though they signed a number of articles on which they could agree

and promised to be mutually forbearing, there was still much bitterness of feeling between the more extreme members of each party, and union was for the time impossible.

To the Peace of Nuremberg. — Matters looked so threatening for the Protestants that they formed a league known as the League of Smalkald for mutual defense. This was opposed by Luther because it looked toward war, and he did not believe in pushing his cause by force of arms, holding steadily to the doctrine of passive obedience, that is, the submission of the subject to the civil ruler. The danger to the Protestants was averted for the time by another war which the emperor found on his hands. This was the war against the Turks. It was essential to Charles V. to have a united Germany to drive back the invading Turks, and, to secure this, some concessions were made to the Protestants in the Religious Peace of Nuremberg, 1532. By this peace matters were to be left as they were, and the Protestants were to retain such privileges as they had until a general council could be called to decide on the question of reform.

To Luther's Death. — During the next ten years Protestantism made rapid progress. Charles was involved in a war with France in 1536. In 1538 the Catholics formed the Holy League at Nuremberg, so the two parties were arrayed against each other; but Luther's influence was constantly exercised on the side of peace, and peace was maintained down to the year of his death in 1546. Though he strove for peace, he would not hear of a compromise on religious matters. A few years before his death the papal legate had shown a willingness to grant several important points to the Protestants; but Luther refusing to abandon anything in return, the compromise was not brought about.

The Character of Luther. — Even now after 350 years have passed it is hard to form an impartial opinion of Luther's character. His friends are so devoted and his enemies so bitter that the facts of his life are colored by fancy or distorted by prejudice. That he was a sincere and earnest

man can not be doubted. He was a singularly bold and vigorous champion of a new cause. In pressing his points, however, he often used means that were not judicious. His language was often violent and his attitude, both to his enemies and to some of his would-be friends, was not conciliating. There was an excuse for this in the intensity of his convictions and in the fierceness of the disputes in which he found himself involved. He has been blamed for the language of his controversial writings. It has been said of him that "he bellowed in bad Latin"; that his language was unnecessarily abusive. Still we must remember that the language used by others toward him was not of a kind always to call for a gentle retort. Henry VIII. called him "the hound who brought up heresies anew out of hell." Luther retorted in an equally abusive strain, and when he afterwards apologized for writing in that style, Henry treated his apology as if it were an acknowledgment of defeat.

If there is some excuse for the violence of Luther's language, there is still more for his intolerance. Intolerance was the spirit of the age. To believe oneself right in religious matters then meant that the other party was of necessity wrong and must be made to abandon his error. Uniformity in religious belief was regarded as necessary, and neither Protestants nor Catholics would tolerate heresy if they could help it.

The Religious Peace of Augsburg.—An account of the first and second Smalkaldic wars has already been given. We have seen that the emperor was successful in the first, but that he made such bad use of his victory as to provoke the Protestants to a second revolt; and, in the attempt to suppress this, he failed completely. The treaty closing the second Smalkaldic war is known as the Religious Peace of Augsburg (1555). This gave to the princes of Germany right of choice between the Protestant faith as embodied in the Augsburg Confession, and the Catholic religion. Having once chosen between these two faiths, the prince could expel from his

country any person who professed a different creed. Thus the religion of the prince was to be the religion of the land over which he reigned.

An important clause in the treaty was that known as the Ecclesiastical Reservation. This provided that if an ecclesiastical prince, that is, a bishop or abbot, should turn Protestant, he must give up his office and his revenues. This article was in the interest of the Catholics, and could not fail to be displeasing to the Protestants. It was destined to be the cause of a renewal of the religious strife.

CHAPTER XLVII

THE REFORMATION IN ENGLAND

Henry VIII. (1509-1547). — Henry VIII. came to the throne in 1509, inheriting a vast treasure which he owed to the avarice of his father. A young and active man, he was ambitious in the early part of his reign for military distinction, and sev-

eral times he took part in the wars on the continent. These wars gave England small glory and no practical advantage.

HENRY VIII.

The only brilliant military achievement of the reign was gained when Henry was abroad; this was the battle of Flodden Field in 1513, where the English defeated the Scotch army which was sent across the border to plunder the northern counties.

Cardinal Wolsey. — In the early part of Henry's reign the most conspicuous figure in his court was Cardinal

Wolsey, whom he made his counselor and who soon gained great influence over the mind of the king. Both the king and his counselor were friends of the new learning, and gave liberal encouragement to men of letters. Wolsey was ambitious to become pope, and succeeded in gaining the favor of Rome and the appointment as cardinal and papal legate. But, while the minister's ambition bound him to the side of the pope, the king, his master, was finding a motive for a breach with Rome. This came about through Henry's desire for a divorce from his wife, Catherine of Aragon, who had been the wife of Henry's elder brother.

The Divorce. — Down to the time of the difficulty over the divorce question, Henry had been one of the staunchest supporters of the Roman Catholic Church. In the eighth year of his reign he had written a book against Luther, and for his zeal on behalf of the Church had received from the pope the title of Defender of the Faith. As to the divorce, Henry claimed that he desired it on account of religious scruples. To marry a deceased brother's widow was wrong in the eyes of the Church, but this matter had come up when the mar-

riage was proposed and the pope then ruling had granted a dispensation, making the union legal. Henry professed to believe that this act of the pope was contrary to Church laws, and that it was the duty of the present pope to declare that the marriage was illegal and therefore of no effect. In the meanwhile, however, he had fallen in love with a maid of honor named Anne Bo'leyn, and it is a question how far this attachment influenced his course. The question was further complicated by the fact that Queen Catherine was the aunt of Charles V., whom the pope was afraid to offend. When the matter was referred to Rome, Clement VII. pursued a policy of delay, appointing a papal legate from Italy and Cardinal Wolsey as commissioners to decide on the validity of the marriage.

The Fall of Wolsey.—It is probable that Wolsey did not show himself especially active on his master's behalf. At all events, Henry took it into his head that his minister was purposely dilatory and he suddenly deposed him from his offices and charged him with treason. Wolsey, broken-hearted at this change in his fortune, died on the way to answer to the charge.

The Breach with Rome.—Henry now took matters into his own hands. He appointed as his chief minister Thomas Cromwell, a man who opposed the temporal power of the pope. Henry's interest was furthered also by securing Parliaments that were hostile to Rome. Acting on the advice of Cromwell, he secretly married Anne Boleyn. His new archbishop, Thomas Cranmer, then annulled Henry's marriage with Catherine. The pope now excommunicated Henry; but there was a powerful party in England on the latter's side and the excommunication did no damage. Parliament passed what was known as the Statute of Appeals, making it criminal for an Englishman to appeal to Rome from the decision of an English court. This was the first step in the separation from Rome. The final measure was the Act of Supremacy (1534), by which Henry was made the supreme head of the Church of England, with complete control over all ecclesiastical offices and revenues.

The New Church. — The new Church was neither Roman Catholic nor Protestant. It retained the doctrines of the former, but, in place of the pope, the head of the Church was the king. To deny the supremacy of Henry was high treason, punishable by death. At first Henry seemed inclined to introduce changes favored by the Protestants, but in the latter part of his reign he enforced strictly the Roman Catholic doctrine. Thus there were two parties who were each liable to severe persecution, — the Protestants, since they could not accept the doctrines of the Anglican Church, and the Roman Catholics, since they could not admit the supremacy of the king in religious matters. It has been said that men were hanged for opposing the king, and burned for siding with him.

Suppression of the Monasteries. — In the latter part of Henry's reign his government was exceedingly harsh. One of the severest measures of this period was the suppression of the monasteries, which was carried out by Thomas Cromwell with merciless thoroughness. First a commission was appointed to investigate the moral life of the monasteries, in order that by proving them to be corrupt there might be an ostensible reason for their suppression. The charge of immorality was probably substantiated in the case of some of the smaller monasteries, but the larger ones do not appear to have had a bad character. All, however, were destroyed, and their property and revenues were confiscated to the crown. The wealth thus gained was in part bestowed by Henry upon courtiers whom he wished to attach to his interests. This policy was successful; for those who received the lands were naturally opposed to the return of the old Church, lest their property should be taken from them.

Changes in the House of Lords. — Another important result of this act was the change in the character of the House of Lords. The abbots had formerly made up a considerable part of that body, the abbots and bishops together outnumbering the secular members. Now that the abbots were deprived of

all their offices and dignities, the lay element in the House of Lords became the most numerous.

In spite of Henry's severity and even cruelty, he somehow contrived to retain his hold on the good will of his subjects. He was a popular ruler. In his private life he was immoral. He was married six times, and of his wives two were divorced, two were beheaded at the king's order, one died a short time after marriage, and the last, Catherine Parr, outlived him.

CHAPTER XLVIII

THE REFORMATION IN OTHER EUROPEAN COUNTRIES

The Swiss Reformers. — The leader of the Reformation in Switzerland was Zwingli, who was born in 1484 and educated at the University of Vienna, where he acquired a taste for the new learning. Like Luther, he came to believe that the Church doctrines on the subject of penance were wrong. He opposed the purchase of indulgences. He also questioned the authority of the pope and predicted the fall of the papacy. When an agent of the Church, named Samson, began the same practices in Switzerland that Tetzel had employed in Germany, Zwingli preached against him. Acquiring a great reputation for his eloquence, he drew crowds to hear his sermons. In

many of his views he approached Luther, but was inclined to go somewhat farther than Luther and differed radically from him, as we have seen, on the subject of the Lord's Supper.

In 1524 the canton of Zurich declared its independence of its Catholic bishop and became Protestant. Its example was followed by other cantons, and soon the Roman Catholics and the Protestants were arrayed against each other. The Protestants were in the majority, but were divided by jealousy. It was Zwingli's idea to form the cantons that had joined the new faith into a republic, but each city wished to be the capital of the new republic, and when the war broke out between the Catholics and the Protestants, the latter did not act in harmony. The Protestant army was defeated at Cappel in 1531 and Zwingli was killed. Disunion among the Protestants still continued and an unfavorable peace was formed with the Catholics, who regained much of what they had lost. Thus in Switzerland, as in Germany, the country was divided against itself on religious matters.

Calvin in Geneva. — John Chauvin, or Calvin, was one of the greatest leaders of the Reformation. He was born in 1509, in France, and received a careful education, in the course of which he showed unusual gifts as a scholar. While still very young, he became an ardent Protestant and was obliged to flee from Paris. He published in his *Institutes of the Christian Religion* a remarkable exposition of the Protestant faith. His system of theology was logical and systematic. His views differed from Luther's in regard to the Lord's Supper and in certain stern doctrines on the subject of God's sovereignty.

In 1536 he took up his residence in Geneva in Switzerland, which had become a Protestant city. His influence raised him to the position of the virtual ruler of the city, which he turned into a sort of religious republic, administered in the strictest manner. Purity of life and orthodoxy of faith were enforced by rigorous laws, but, in spite of the somewhat gloomy character of his rule, Geneva became a resort for earnest Protestants of all lands. The influence of Calvinism

spread into France, England, Scotland, and Germany, and since it differed in several respects from the Protestantism of Luther and the Protestantism of Zwingli, there was now a threefold division of the Protestant world.

Denmark and Sweden. — In Denmark and Sweden the religious question was mixed up with political issues. Christian II., the king of Denmark, was bent on crushing the power of the nobility, and to accomplish this he made an attack on Sweden in order to force the Swedes to aid him against his own subjects. In this campaign he seized the Swedish city of Stockholm and massacred many of the Swedes. This caused him to be detested by both the Swedes and his own countrymen, and an uprising in Denmark drove him from the throne. His successor, Frederick, who became king in 1523, was a Lutheran, but had promised not to introduce the new faith. Nevertheless Protestantism had been preached in Denmark with success. The nobles favored it and, in 1527, it received toleration. Nine years later it became the established faith in Sweden. There the young king, Gustavus Vasa, was favorable to Lutheranism and, although the peasantry were deeply attached to the old faith, Protestantism made rapid progress. It was helped by the king's attacks on the Church, for it was his policy to weaken the aristocracy, both lay and clerical.

CHAPTER XLIX

ARREST OF THE REFORMATION

The Division of Protestantism.—One of the most serious checks to Protestantism was the lack of union among the Protestants themselves. The Catholics had said that when once the spirit of dissent had arisen it would go to all lengths and lead to endless divisions. If a body of reformers, exercising their private judgment, could withdraw from the Church, it was probable that others would follow the same plan and withdraw from the new organization. The Protestants were, as we have seen, divided into the three main branches of Lutherans, Calvinists, and Zwinglians. This was very early in their history and, as time passed, the divisions and subdivisions multiplied. It was evident that this disunion must cause weakness. Moreover, there was not merely a lack of agreement, but positive bitterness between the Protestant sects.

Order of the Jesuits.—The Order of the Jesuits was founded in 1540, through the influence of Ignatius Loyo'la, who was chosen as its head. Its object was to fight the battles of the Church in this time of religious strife, to prevent the spread of heresy, and to reconvert those who had fallen away from the orthodox faith. Its distinctive feature was the fact that its members were exempt from the ordinary monastic duties, and could devote themselves more extensively to preaching, hearing confessions, and educating the young. The Jesuit could mingle in society, and take part in any affairs of active life. But absolute and unquestioning obedience, in all things not sinful, even to the sacrifice of their lives, was required of all the members of the order. The education of the young, especially of those in the higher walks of life, fell into their hands. From southern Europe they spread through all of what was called the "debatable land"; that is, those countries in which

there was uncertainty as to the issue of the struggle between Protestantism and the Roman Catholic faith. Their work was exceedingly successful. In France, Belgium, southern Germany, Bohemia, Moravia, Poland, and Hungary, they did much to prevent the spread of Protestantism, and to win back those who had abjured the old faith.

The Inquisition. — The Inquisition was an extraordinary court, which appeared first in the time of the Albigensian heresy in France. It was revived in Spain in the reign of Ferdinand and Isabella for the purpose of seeking out “relapsed Jews”; that is, Jews who, after being forcibly converted to Christianity, had fallen back to their old faith. Its methods were high-handed, and its authority was superior to that of the other courts. In Spain it was closely connected with the civil power, and was often used by the sovereign to carry out his own plans.

The methods applied by the Inquisition against Protestantism were very severe. Its proceedings were arbitrary, and those who were brought before it had not a fair chance of justice. As to the numbers burned at the stake, or otherwise punished as a result of sentences, there is great diversity of opinion. It is probable that in the time of Torquema'da (1490), the number was very large. One of the duties of the court was the suppression of heretical books, and it fulfilled this duty with much fidelity, in some cases destroying all copies of a published work.

The Counter Reformation. — By this is meant the effort of the Church to reform itself from within. We have seen already that the Church, at times, showed itself willing to make some advances toward the Protestants and remove some of the alleged abuses. The attacks on the Church had the effect of impelling its members to adopt some important reforms.

Council of Trent. — In 1545 the Council of Trent was assembled by the pope, Paul III. The Protestants had hoped much from it, but soon found that reconciliation was impossible. Early in its session, the council declared against the chief

Protestant doctrines, and after Charles V. had gained his first victory over the Smalkaldic League, the council reasserted all the old doctrines of the Church. Yet it declared definitely against some of the abuses of which the Protestants complained. For instance, it issued a decree against those "who availed themselves of the word of God in order to fill their own pockets with lucre." What the Church gained by the Council of Trent was a clear statement of its doctrines and an improvement in its organization.

General Results.—During the first period of the Reformation Protestantism made a very rapid advance. Its advance was checked by the four causes mentioned; namely, the dissension among the Protestants, the founding of the Order of the Jesuits, the vigorous measures taken to repress heresy, and the purification and improvement of the Church itself. As a result, the Catholics regained much of what had been taken from them, and prevented many threatened losses.

In general, the Teutonic countries of Europe were favorable to the new faith, while the Latin nations adhered to the old. In Spain and Italy the movement made no progress. In France it made some advance at first, but did not retain its strength. Germany was divided into Protestant and Roman Catholic states, southern Germany generally being Roman Catholic. England, Scotland, and the Scandinavian countries became Protestant, and Switzerland partly so.

CHAPTER L

ENGLAND IN THE SIXTEENTH CENTURY

The Period. — The period treated in this chapter extends from the death of Henry VIII. in 1547, to the end of the Tudor dynasty, with the death of Elizabeth, in 1603. This was the closing period of the Reformation in England, and was also a time of commercial development and intellectual advancement.

Edward VI. (1547-1553). — Edward VI., the son of Henry VIII. and Jane Seymour, was but ten years old when he came to the throne, but he showed a knowledge and power of understanding far beyond his years. The main interest of the reign is on its religious side. The Protestants gained the upper hand. The Roman Catholic doctrines retained in the Church of Henry VIII. were abolished, a new creed was formed, and the Book of Common Prayer was issued. The change was too sudden and complete to please the majority of the people. Moreover, the Protestants went to extremes in the destruction of images, in the removal of crosses and decorations from the churches, and in other departures from the customs and ceremonies of the old organization. Those who would not accept the changes in doctrine and worship were persecuted. Edward VI., under the advice of one of his ministers, declared his second cousin Lady Jane Grey his heir to the throne in defiance of the claims of the rightful heir, Mary Tudor, the daughter of Henry by Catherine of Aragon.

Mary Tudor. — Lady Jane Grey fell a victim to the schemes of her advisers. On the death of Edward VI., the plot to place her on the throne failed, and she was later put to death. Mary became queen. She had been trained in the Roman Catholic faith and was determined to restore the old Church. There was some opposition to this from her Parliament and from that class which had benefited by the suppression of the monasteries. The work of Edward VI.'s reign, however, was

swept away, and severe measures were adopted against the Protestants. In the course of her reign it has been estimated that over 200 Protestants were put to death for religion's sake. Among them were men of distinction, like the bishops Cranmer, Ridley, and Latimer, as well as many obscure persons. Her course was unwise as well as unpopular, for she raised up foes against the restored religion. She won for herself the name of **Bloody Mary**.

Loss of Calais. — Another thing which caused the ill-will of her subjects was her Spanish marriage. She became the wife of Philip II. of Spain, and the English people were not pleased with the Spanish alliance. As a result of it, England was on the side of Spain against France, and in the war which followed, the last stronghold of the English in France, Calais, was taken by the French. Soon after this reverse the queen died.

Elizabeth. — Elizabeth was the daughter of Henry VIII. by Anne Boleyn. Her reign is one of the most remarkable in English history. It lasted from 1558 to 1603, and in those years England's glory was brighter than it had ever been before. Elizabeth was not extreme in her religious views. She was probably lacking in religious feeling, but, on the whole, inclined toward the Protestant system, though not bitter against the Roman Catholic Church. Accordingly, the Church of Elizabeth was less Protestant than that of Edward VI., but did not retain the

ELIZABETH

Roman Catholic doctrines of the Church of Mary and Henry VIII. It was a Protestant Church, but kept the old forms of worship.

Mary Queen of Scots. — When Elizabeth came to the throne of England, the people of Scotland were fast becoming Protestants under the influence of the stern old preacher John Knox, who had become a thoroughgoing Calvinist. In a few years the Presbyterian faith was established as the religion of Scotland. Mary Stuart, the Scottish queen, however, was Roman Catholic. She had married the French king Francis II. and on his death returned to Scotland to rule. She wished to restore there the Roman Catholic religion, but the influence of Knox was too strong to permit this. She was the great-granddaughter of Henry VII., and thus a dangerous rival of Elizabeth; for she had unusual beauty and charm of manner, and her views and purposes made her the natural rallying point for the Catholics of both kingdoms. In her conduct she was not discreet. Having married a Scottish noble named Darnley, a worthless character, she grew to despise him, and, after his murder under suspicious circumstances, she became the wife of Bothwell, who had been the chief person concerned in the plot for the murder of her husband. Her subjects rebelled against her and she was obliged to abdicate. She fled to England for protection, but Elizabeth took the side of the Scottish people and Mary was shut up in prison.

Even in prison Mary was a very dangerous rival of the queen; for she was a Catholic and the heir to the throne, and as such she became the center of Catholic plots. There were many people in England who would have been glad to see Elizabeth put out of the way and Mary installed in her place. For these reasons it was a matter of policy on the part of Elizabeth to keep a close watch on her rival.

To the Protestants of England every Catholic appeared as a possible conspirator, and there was some reason for this, because, in 1570, the pope excommunicated the queen and absolved all her subjects from their oath of allegiance. Many plots were formed among the Catholics, but they were all discovered and numerous persons were put to death.

Execution of Mary. — Finally a young Englishman named

Babington planned to assassinate Elizabeth and release Mary from prison. The plot was detected, and its author and his accomplices were executed. Here was a chance to bring Mary to trial on the ground of conspiracy. Historians do not agree as to the degree of her guilt, but the commissioners by whom she was tried condemned her to death, and she was executed February 8, 1587, displaying marked heroism on the scaffold.

The Spanish Armada.— Philip II. of Spain at once determined to avenge the execution of Mary Stuart. Moreover, he was angry with Elizabeth for the aid which she had rendered to his rebellious subjects in the Netherlands and was bent on overthrowing the Reformation in England. In 1588, after extensive preparations, one of the largest fleets that a Christian nation had ever sent to sea sailed from the mouth of the Tagus against England. Its command was in the hands of the Duke of Medina Sidonia.

There was great excitement and alarm in England, for the country was ill-prepared to meet so formidable an attack. In the presence of this danger all classes united, even the Catholics flocking to the royal standard in defense of the nation. With a fleet very inferior in point of numbers to the Armada, but commanded by some of the ablest seamen of the age, namely, Admiral Howard as commander in chief, and Drake, Hawkins, and Frobisher as his lieutenants, the English set sail to meet the Spanish.

Destruction of the Armada.— The Armada appeared off the coast of England in July, 1588. The English vessels, being of smaller size and fewer in number, did not venture on an open combat, but contented themselves with harassing the Spaniards as they advanced. Their light build and rapidity in action gave the English ships an advantage and by means of fire ships many of the Spanish vessels were destroyed. After some desultory fighting an attack was made on the Spanish fleet, inflicting severe loss. The Armada then sailed northward, hoping to escape by passing around to the north of the British Isles, but ill luck had followed it from the first. When

the Spaniards reached the northern waters, they were dashed by storms on the Scottish and Irish shores. In all, nearly two thirds of their vessels, with almost one half of their men, were lost or captured.

Decline of Spain. — This great victory raised England to a high place among maritime nations and dealt a blow to Spain from which she did not recover for many years. From this time, in fact, the prestige of Spain began to decline. Philip had worked at this project for five years and it had proved an utter failure, and the remaining years of Elizabeth's reign were, so far as her foreign policy was concerned, years of uninterrupted success. An English fleet dared to sail up the river Tagus, and another attacked and pillaged the Spanish city of Cadiz.

The Religious Policy of Elizabeth. — Although Elizabeth herself never showed any especial religious zeal, her reign was marked by considerable religious persecution; for the policy of the time was to enforce absolute uniformity in religious belief. Persecutions were directed first against the Catholics because they could not accept the doctrines of the Anglican Church, or the supremacy of the queen in religious matters. They found themselves in the position of traitors to the State, and their persecution was on political more than on religious grounds; for they could not consistently, with their religious belief, admit the right of Elizabeth to the throne. Hundreds of them were put to death on account of plots or insurrections.

The Puritans. — Another party of Christians who came in for a share of persecution was the Puritans. They were so called because they wished to purify the Church and carry the Reformation further in England. They wanted to make the Church of England simpler and more republican in form, and they hated the ceremonials and liturgy as "badges of popery." They did not at first leave the Church, but used their influence to reform it from within. Their attempts, which were characterized by courage and persistency, brought down upon them the vengeance of the State.

The Independents. — There was a third class of nonconformists, that is, of those who would not accept the established religion, and these separated altogether from the Church. They were called Independents, and they set up little religious societies of their own. They were more radical than the Puritans, and naturally they suffered heavily at the hands of the authorities.

Commerce and Discoveries. — Elizabeth's reign was a period of great commercial enterprise and maritime activity. Among

A BARBER SHOP IN THE SIXTEENTH CENTURY

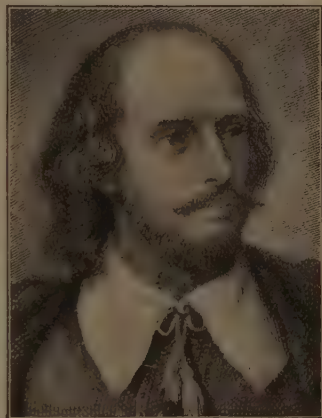

the daring adventurers and navigators of the time were Drake, Frobisher, Hawkins, and Raleigh. Sir Francis Drake was a brilliant adventurer. He sailed to the American colonies of Spain in 1577, forced them to pay large sums of money, and then, continuing on his voyage, captured many Spanish vessels and returned to England with a rich booty, after having completed the circuit of the globe. On another occasion, just before the Armada left Spain, he

went on a plundering expedition to the Spanish coast and destroyed vast supplies of stores which Philip had gathered for the purpose of fitting out his fleet. In the hostility between England and Spain, many bold seamen like Drake led privateering expeditions and did infinite damage to Spanish commerce, waylaying Spanish vessels on the high seas and pillaging Spanish ports in all parts of the world.

Of more prominent and lasting benefit was the work of men

like Frobisher and Davis, renowned for their discoveries in the Arctic seas. Sir Walter Raleigh fitted out a number of colonial enterprises, one of which explored the coast of North America, and returned to England with an account of a fair and fertile land which was called Virginia, in honor of the virgin queen.

Intellectual Activity.—The vigor and originality which are marks of this period in English history appear conspicuously in the literature of the time. The Elizabethan era surpassed all previous periods in the brilliancy of its literature, and many works which are still regarded as the greatest works of their kind were produced in that time. It would be impossible here to mention the names of all the

SHAKESPEARE

great Elizabethan writers. It is sufficient to state that this was the time of Shakespeare, Ben Jonson, Edmund Spenser, Sir Philip Sidney, Francis Bacon, and Richard Hooker.

The Character of Elizabeth.—Elizabeth died in 1603. She was a woman of great power of mind and imperious character. She remained single through life, fearing that if she married she would find a master. Her will was impatient of all control, and her pride was intense. Being inclined toward the Protestant faith, she was obliged to conceal her feelings during the reign of her sister Mary. Long practice in deceit may have developed the lack of truthfulness which was a marked trait in her character. Another fault which was evident in her life was her vanity. She would listen to the grossest flattery with keen pleasure, and her favor was often won by the unworthy by playing on this weakness in her character. She was, moreover, a person of violent passion and impetuous temper.

Nevertheless she had many fine qualities. Few kings have shown a higher courage than hers, or a more skillful statecraft. In spite of her headstrong will, she knew how to yield when occasion demanded it. For instance, when people complained of her abuse of power in granting monopolies to her favorites, she gave up the practice. When she yielded, she did so graciously and fully, not grudgingly as if by compulsion, and her concessions won her many friends. She chose for her ministers the ablest men of the times, but her own wisdom sometimes surpassed that of her counselors. Whatever her faults, she won and retained the affection of her subjects to a remarkable degree, even among those who had the best reason for hating her. A curious illustration of this appears in the story of a Puritan Nonconformist who was condemned to mutilation for his religious views. When one hand was cut off, he waved the stump in the air, shouting "Long live the queen."

CHAPTER LI

THE REVOLT OF THE NETHERLANDS

The Netherlands. — The Netherlands, comprising the strip of low country along the coast of western Europe, now divided into the two states of Belgium and the Netherlands (Holland), consisted of a number of little provinces all united under the government of Spain. This region was for its size the richest country in Europe during the sixteenth century. In their early history the provinces had been subject to Germany or France. Later they passed under the control of the house of Burgundy, and finally by marriage passed to the house of Hapsburg, becoming the inheritance of Charles V. On the death of Charles V., his son Philip II., as king of Spain, became the sovereign of the Netherlands.

There was a marked difference between the northern and southern provinces. The northern part, corresponding to the kingdom of Holland to-day, was chiefly Teutonic. In the south the old tribe called the Belgae had lived in Roman times, and in this region the Celtic element was predominant.

Charles V. and the Netherlands. — Charles V. had used great severity in crushing out heresy in the provinces, where the Reformation had taken root, but being a Fleming by birth, he had sympathy with the natives, and in all respects, save in matters of religion, he governed them with a fair degree of justice. Moreover, he seemed to look upon them as his countrymen, and filled many of the highest offices in his gift with Flemings. He had the commercial interests of the country at heart also, and did much to open up new fields to trade.

Philip II. and the Netherlands. — Philip II., the bigoted and morose successor of Charles, departed in some important respects from the policy of his father. He offended the pride of the nobles in the provinces, by refusing to take them into his counsel. In dealing with the Netherlands, he seemed to have

but one purpose, and that was to uproot heresy, at whatever cost. His whole policy was of a kind to arouse the hatred of his subjects, and it comprised no features that could compensate for the wrongs which they were obliged to endure. He established new bishoprics in the country, stationed Spaniards in the chief cities, and gave the important offices to foreigners.

The 'Beggars.' — After ruling personally in the Netherlands for a while, Philip placed the government in the hands of his half-sister, Margaret of Parma. During her rule, which lasted from 1559 to 1567, the grievances of the natives became intolerable. Her adviser was Granvelle, a man devoted to Philip and bitterly hostile to the Protestants. The measures against the Protestants finally aroused such intense opposition among the nobles that Granvelle was recalled, and Margaret showed a willingness to compromise.

Before any agreement was reached, however, the people, who were impatient of delay, broke out in revolt. The nobles could not restrain them. They attacked the churches, destroyed the images, and overthrew the altars. These excesses merely angered Philip, and drove him to harsher measures. In the meantime, a body of deputies had come to Margaret with a petition, setting forth the wrongs of the country and begging for their redress. To reassure the frightened regent, one of the counselors remarked that the petitioners were only "beggars." The word was taken up by the party of reform, and thenceforth its members were styled Beggars.

Alva's Government. — On Margaret's failure, Philip made up his mind that he would send to the Netherlands a governor who would bring the people to their senses. He declared that he would maintain the Catholic faith in the provinces at any cost. Alva was an able general, and a man without scruple and without mercy. He brought with him to the Netherlands a large body of the best troops of Spain. His appearance was the signal for many of the more prudent leaders of the Protestants to withdraw. Counts Egmont and Horn ventured to remain, but they paid the penalty of their daring with their lives.

Alva set up in the Netherlands a special tribunal, whose remarkable effectiveness in carrying out the policy of the government earned for it the title of the Council of Blood. Thousands of persons were executed, still more were robbed of their property, and an even larger number left the country. Besides this, an enormous tax was levied on merchandise, resulting in the almost complete destruction of the Flemish trade.

Meanwhile, the party of the Beggars had planned forcible resistance to the Spanish ruler, and the cruelty of Alva drove many to their side. At first their activity was confined to naval warfare. They captured the city of Briel, and in so doing saved the lives of the burgesses of Brussels, who, having started an unsuccessful revolt, were captured and about to be hanged. Immediately after the seizure of Briel, the provinces of Holland and Zealand took up arms (1572). Thus began the long struggle between the provinces and Spain, known in history as the Revolt of the Netherlands.

William of Orange. — William, Prince of Orange, called ‘William the Silent,’ was the natural leader of the Netherlands at this crisis, and he was chosen by Holland and Zeeland as their governor. He was the determined foe of Spanish tyranny, and his strength of mind and far-sighted statesmanship gave promise of success. Yet, for the little country of the Netherlands to stand out against the mighty power of Spain would have seemed foolhardy, had it not been for the fact that the Protestants of Germany, England, and France could be relied upon for aid. In military strength and in the brilliancy of generals, Spain had greatly the advantage. Her armies were commanded successively by the greatest

WILLIAM THE SILENT

soldiers of the time, — Don John of Austria (1576–1578) and after him Alexander Farnese, Duke of Parma. Against their skill was pitted the high courage and inflexible will of William, who, like our Washington, was greatest in the time of difficulty and defeat.

Siege of Leyden. — Alva's unscrupulous and cruel government had failed completely. He was recalled and replaced by a new governor named Requesens (1573). The latter was more conciliatory than Alva, and tried to win friends by favor as well as by force.

In 1574 took place the famous siege of Leyden, which is interesting as showing the means which the Netherlands employed in defense. The siege had been begun by Alva's army and was continued by the troops of Requesens. The Spanish troops closed their lines around the city, soon shutting off all means of obtaining provisions, and the Prince of Orange tried in vain to throw troops within the walls to aid the garrison. At last the plan of cutting the dikes and flooding the land around the city was proposed. This was done, and the level country in the vicinity was flooded for miles around. This made it possible to float ships carrying provisions. The water, however, became too shallow as the ships approached the city, and it seemed as if it would be impossible to reach the inhabitants; but, a heavy wind arising from the north and carrying high waves across the broken dikes, the vessels were carried nearer to the walls. They were again stranded and many of the citizens in despair were urging surrender, but again the waters poured in, driven by the wind, and the ships were carried into the canals of the city.

Pacification of Ghent. — In the southern provinces Requesens was more successful, but he died in 1576, and when his powerful hand was withdrawn his troops committed a terrible massacre known as the 'Spanish Fury.' In this it is said more people perished than were killed in the massacre of St. Bartholomew in Paris (page 389). The terror and hatred aroused by this act led to the formation of a union between all the seventeen

provinces. This was called the Pacification of Ghent (1576). At the head of the union was William of Orange.

Union of Utrecht. — The Pacification of Ghent did not last long. The provinces differed in religion, the northern ones being in favor of the reformed faith and the southern being generally Catholic. Don John of Austria was in favor of peace and tried to win over the Protestants to a compromise, but the distrust of the latter prevented this. The interests of the south and the north were opposed not only in matters of religion, but in matters of trade; for the southern provinces were largely manufacturing states, and the seven northern provinces were commercial.

The southern provinces broke away from the union and acknowledged Philip II. as king. The seven northern provinces, consisting of Holland, Guelderland, Utrecht, Zealand, Friesland, Overijssel, and Groningen, formed the so-called Union of Utrecht in 1579, making themselves into a federal republic, in which each governed its local affairs and was represented in the general Federal Assembly. The governor general, or stadtholder, was William of Orange. This was the beginning of the Dutch Republic. Two years after the formation of the union, the States-General, or Federal Assembly of the united provinces, solemnly renounced the authority of Spain.

Death of William of Orange. — Spain was as far as ever from subduing the northern provinces. The credit for their long and successful resistance belongs almost wholly to William of Orange, and naturally the Spanish monarch made him the object of his bitterest hatred. William had proved himself above all selfish motives by refusing to accept, from the Spanish court, offers of dignities and wealth, if he would abandon the cause. After the failure of these attempts at bribery, Philip devised a plan of assassination. He published a ban, declaring the prince an outlaw and promising money and noble rank to any one who would kill him. Six attempts were made on the life of the prince, and finally he was shot in his own house.

Character of William. — William of Orange is one of the heroic characters of history. He was not a brilliant general, but he knew how to wait and turn his reverses to account. His prudence and foresight were of a high order and his personal courage was remarkable. After the shameful edict in which a price was put upon his head, he published an 'apology,' in which he attacked the king in the most scathing manner and made fun of his attempts to frighten him; and although he knew that his life was in danger, he showed neither fear nor irresolution. His habit of keeping his own counsel, which at times amounted to a fault and led him into a course bordering on deceit, gained for him the surname of the 'Silent.'

Progress of the War. — In the early part of the war the Netherlanders were disappointed in their hope of aid from the Protestants of the neighboring countries. Later, however, aid came from England. After the murder of the Prince of Orange Elizabeth became an open ally of the Dutch and sent to their relief, among others, her famous captain, the chivalrous Sir Philip Sidney, who fell at the siege of Zutphen, in 1586. France also entered the lists against Philip and the Spaniard was hard pressed both on land and sea. The havoc which the English wrought in the commerce of Spain has already been mentioned. The Dutch fleet seized many of the East Indian possessions of Spain, and the English and Dutch together destroyed the Spanish fleet in the bay of Cadiz.

The Independence of the Netherlands. — The struggle dragged on for several years, and came to an end from the exhaustion of the parties to it. In 1609 a treaty was formed, acknowledging the independence of the united provinces of the Netherlands—that is, the Dutch provinces, or Holland. This it did in effect, but nominally it was regarded by Spain as a truce for twelve years. Spain, however, never regained her authority over the provinces, and, by the Peace of Westphalia (1648), the freedom of Holland was formally acknowledged.

Growth of Dutch Commerce. — The downfall of Spain's

tyranny over the Netherlands was followed by a period of remarkable improvement in the provinces. This was far more marked in the northern provinces, which had regained their independence, than in the southern provinces, which had given up the fight for liberty. The Dutch became the foremost commercial people in the world and were the equals, if not the superiors, of all other races in regard to their progress in arts, in literature, and in the spread of education. The work of building up a great colonial empire was begun and colonies were planted in the most remote parts of the world. The West India Company planted a colony on Manhattan Island (afterwards New York), and the Dutch had settlements in the East Indies and the distant islands of the Pacific. This maritime activity, which had always been characteristic of the Dutch, continued throughout the sixteenth century and has not been relaxed to the present day; for now Holland, though among the smallest of European powers, is one of the greatest in respect to the extent of her colonial possessions.

CHAPTER LII

FRANCE IN THE SIXTEENTH CENTURY

French Protestantism. — The reformers in France were termed Huguenots. They were not followers of Luther, but adopted the sterner faith preached by John Calvin of Geneva. The new movement had made some headway during the reign of Francis I., but its progress was more rapid under that king's successor, Henry II. Between 1555 and 1559, about two thousand Huguenot churches were founded in France, and in the southern and western part of the country the new faith was especially strong. The Reformation was not so popular in France as in Germany; partly because the lack of central power in Germany gave the movement a better chance than in France, where the king was more absolute, and partly because France had not suffered so much from the ecclesiastical grievances of which the Germans complained. Calvinism in France seemed to appeal more to the nobility or the well-to-do classes than to the lower orders of the people, who remained devoted to the old faith. It was not a great popular movement in France and was there identified to some extent with a political aim; namely, the purpose of securing greater independence for the nobles.

Persecution of the Huguenots. — The Huguenots suffered the usual fate of heretics. They were put to death in large numbers and the spread of their doctrines was prohibited. These persecutions went on during the reign of Francis I. (1515–1547) and of Henry II. (1547–1559). The time and energy which each of these monarchs had to devote to foreign wars gave the Protestants an occasional respite. Francis, as we have seen, was largely occupied in the wars with Charles V. and Henry II. had a Spanish war on his hands which came to an end in 1559, but in the intervals of peace the Protestants suffered very severely. Soon after the conclusion of the war

with Spain, Henry II. was killed in a tournament at Paris (1559).

Catherine de' Medici. — Henry II. was succeeded by Francis II., then only sixteen years of age. During his brief reign (1559–1560) and the reigns of his two successors, Charles IX. (1560–1574) and Henry III. (1574–1589), the most important figure at the French court was Catherine de' Medici, the widow of Henry II. She was an Italian woman of remarkable ability, but absolutely without principle. She was consumed by ambition, and although her policy was in the main favorable to the Catholics, it is probable that selfish motives rather than religious zeal dictated her course. The three kings just named were among the most incompetent of French sovereigns, and Catherine's life was spent in plots and intrigues for the purpose of getting all power into the hands of herself and her friends. To accomplish this, she was ready to use any means, however base or cruel.

Opposing Parties. — The leaders of the strict Catholic party were the heads of the Guise family; namely, Francis, Duke of Guise, a soldier of some renown, and Charles, Cardinal of Lorraine, his younger brother. They were the uncles of Mary Stuart, who was the wife of the young king Francis II., and through her they hoped to rule France. The chiefs of the Protestant party were the two Bourbon princes, Antony, King of Navarre, and Louis, Prince of Condé. They belonged to the royal family and were heirs to the throne after the brothers of Francis II. An abler and more sincere leader of the Protestants was Admiral Coligny, who for many years had been an earnest Protestant.

The plots and counterplots of the two parties were very complicated, and there were many who shifted their allegiance from one to the other from motives of self-interest. The strict Catholic party looked finally to Spain for aid. Catherine hated the Huguenots, but she feared the Guises, and so her policy was wavering.

The Politiques. — There was a third party in France, not so

strong as either of the others, but holding opinions which triumphed in the end. The representative of this party was L'Hôpital, the greatest lawyer in France. He favored toleration and a regard for the true national interests of France. He wished religious disputes compromised and the people of all classes united to make France a great nation. So the aim of this party was chiefly political and not religious, and from this fact it was termed the party of the Politiques. It was largely composed of moderate Catholics. L'Hôpital was one of the most enlightened men of his time. He advocated tolerance in an age when people scarcely knew the meaning of the word, and he did France a great service in saving her from the terrors of the Inquisition.

The Conspiracy of Amboise. — This was an attempt of some Protestants to overthrow the power of the Guises and place the young king in the charge of the Protestant chief, the Prince of Condé. The Guises discovered the plot in time and seized a great number of conspirators, as well as many innocent persons. Innocent and guilty alike were put to death, and Condé and the king of Navarre were arrested on the charge of taking part in the conspiracy. Before their trial took place, however, King Francis died, and this destroyed the power of the Guises; for since Charles IX., the brother of Francis who succeeded, was only ten years of age, the queen mother acted as regent. She was glad of a chance to weaken the power of the Guises, and Condé and the king of Navarre were released.

The Outbreak of Civil War. — Early in the reign of Charles IX. (January, 1562), the Edict of St. Germain was issued, granting freedom of worship under certain restrictions to the Protestants. This concession was largely due to the policy of the queen regent, for Catherine wished to preserve a balance of parties in order to keep the power in her own hands. For the first time the Huguenots gained an official recognition of their creed, but they made a bad use of their success. They attacked the Catholic churches, broke into the convents,

destroyed the images, and in every way insulted Catholic sentiments. Moreover, the Catholics were opposed to the spirit of the Edict of St. Germain, and determined to prevent its liberal provisions from being carried out. In 1562 the Duke of Guise, traveling through the country at the head of a band of armed followers, came upon a body of Protestants worshipping in a barn in the village of Vassy. They fell upon this little congregation and killed forty of them. The massacre of Vassy brought on the civil war.

The Period of Civil War.—Civil war in France lasted from 1562 to 1598; that is, from the massacre of Vassy to the Treaty of Vervins. During this time fighting was not continuous, but was interrupted by short intervals of peace. Between the dates mentioned eight wars occurred. These years of strife naturally fall into three periods: first, the period of warfare before the formation of the Catholic League, including three short wars; second, the transition period in which occurred the massacre of St. Bartholomew; and third, the period of the league, comprising the wars between the organized Catholic party and the party of the Politiques, the Huguenots being comparatively unimportant in this last period.

The First Period of Civil Strife (1562-1570).—King Antony of Navarre, who, though somewhat faltering in his attitude, had been counted with the Protestants, went over to the Catholics. He was killed in battle and was succeeded by his son, Henry of Navarre, then a child nine years of age. This young prince was a possible claimant to the French throne, and the firm Protestant faith of his mother made it probable that he would become the natural leader of the Huguenots. The chief generals on their side, however, were at this time the Prince of Condé and Admiral Coligny.

It is not necessary here to give the details of all the battles of these wars. At the battle of Dreux (1562) Condé was captured by the Catholics; but while besieging Orleans, soon afterwards, the Duke of Guise was assassinated in his camp. At the battle of Jarnac (1569), in the last of the three wars,

Condé was defeated and killed. The intervals of peace were filled with intrigues and murders, and most of the great leaders on each side fell in battle or at the hands of assassins. On the Protestant side Coligny, under the nominal command of the young Henry of Navarre, continued the war. There were no decisive results, but the Peace of St. Germain was favorable to the Huguenots. It gave them a limited toleration, restored forfeited property, and placed in their hands four fortified cities as places of refuge.

The Transition Period. — There was an interval of two years between the close of these three wars and the massacre of St. Bartholomew, which caused a renewal of hostilities. In the first part of this period the young king, Charles IX., was inclined to the side of the Huguenots on account of his alarm at the schemes of Philip II. of Spain, who, aided by the pope, was planning to place Mary Stuart on the throne of England and Scotland, and to put down the revolt in the Netherlands. If he succeeded, he would gain so great an influence in Europe that France would be brought wholly under his control.

To offset this, Charles planned to unite with the Huguenots and with all the enemies of Philip in Europe. To this end a double marriage was planned; first, the marriage of his younger brother to Elizabeth of England, and second, the marriage of his sister, Margaret of Valois, to Henry of Navarre. He would thus have a great Protestant state in alliance with him abroad, and the Protestant party won over to his side in France, and this, it was thought, would so strengthen him that he would be able to thwart the designs of Philip. Admiral Coligny favored both these plans, but Catherine, the queen mother, opposed them. Her idea was to crush out religious dissent in France by any means, however foul. The alliance with Elizabeth was not made, but the marriage between Henry of Navarre and Margaret of Valois took place. A large body of the Protestants followed Coligny to Paris, and, feeling that their cause had triumphed, they did not conceal their satisfaction. Coligny's influence over the king

increased, and the strict Catholic party, as represented by Catherine de' Medici, the Duke of Anjou, and the Guise family, were enraged. Catherine and Anjou planned to assassinate the admiral, but his assailant succeeded only in wounding him. Then Catherine went to the king, told him that she and Anjou had planned the deed, and explained that the only safety for himself and the friends of the Catholic faith lay in striking a deadly blow at the Huguenots; for she told him that they were already armed to avenge their leader. The weak-minded king listened to this advice, and the massacre of St. Bartholomew was planned.

Massacre of St. Bartholomew.—None of the Protestants seemed to have the slightest suspicion of the plot, which had been developed with absolute secrecy. The massacre was arranged for August 24, 1572, and at a given signal the work began. It is probable that the conspirators had intended to kill only the leaders of the Protestant party, but they had not taken into account the bloodthirstiness of the mob. The Huguenots, taken by surprise, were murdered in their beds, and all those on the northern side of the river Seine were killed. Many of those in the southern part of the city managed to escape, but when the news of the massacre in Paris was spread throughout France, the work was taken up in the provinces, and thousands of the Huguenots all over the country were put to death. The numbers killed are differently estimated. In Paris alone some estimates place the number as high as 10,000; others as low as 2000. Throughout France it is said that from 70,000 to 100,000 Huguenots were killed, but these figures are probably too high; and according to some writers only 22,000 were massacred.

The Guilty Parties.—It must not be thought that the Catholic population of France was wholly in sympathy with this atrocious crime. There were many instances of individual self-sacrifice and humanity. Catholic prelates often intervened on behalf of the Protestants and saved their lives. In several Catholic provinces the Huguenots were unharmed.

Nevertheless, the general attitude of the stricter Catholic party was that in murdering the Huguenots they were performing a holy duty. In Paris religious hatred was in many cases affected by motives of private revenge and of greed, and when the passions of the mob were let loose, many who were not Huguenots were murdered by their private enemies. Debtors in some cases obtained a release from debt by killing their creditors.

Attitude of the King. — Of all those who took part in this crime, the weak-minded and passionate Charles IX. seems to have been the least responsible for his act. Under good counsel he might have developed a better character, but all his life he had been under the unwholesome influence of his mother. After the deed was done many praised him as a public benefactor, and when he found how favorably the public looked upon the act, he declared himself the author of the massacre and went in state to view the corpses of the victims, which were kept for a time on exhibition. Nevertheless, his remorse was sudden and acute. Some say that it hastened his death, and there is evidence that he was a prey to superstitious terrors.

Responsibility for the Massacre. — On the other hand, the Guises were fully responsible for the act. Their family hated Coligny, who, they thought, was responsible for the assassination of the Duke of Guise early in the war. Moreover, their whole course had shown that they regarded assassination as a perfectly proper means for the attainment of personal and party ends and for years before the massacre they had dealt in murder. The Parisian populace seemed in hearty sympathy with this policy of the Guises.

But the guiltiest of all was Catherine. She prompted the massacre, won over the king, and intrigued steadily until she had brought it about. There was nothing in her previous record at all inconsistent with this act.

Philip II., on hearing of the massacre, wrote Charles a congratulatory letter, which shows almost a feeling of envy that

he himself had not performed the deed. Finally, the Huguenots themselves were not free from responsibility in regard to the massacre. They had often shown themselves intolerant, contemptuous, and arrogant, and had threatened the king with war at home if he did not follow out their policy.

Renewal of the Wars. — The massacre of St. Bartholomew diminished the numbers of the Huguenots, but strengthened their faith. It drew to their side also the moderates, as represented by the party of the Politiques, and this party now became prominent. With these new allies the Protestants renewed the war. Thus the object of the massacre was not realized. In fact, after a short time, the Huguenots obtained better terms from the government than ever before.

The Holy League. — In 1574 Charles IX. died and was succeeded by his brother Henry III., who acted generally with the strict Catholic party. Soon afterwards the Holy League was formed by the Catholics, who swore to maintain the Catholic faith, relying for this purpose on outside aid from Spain and the pope. The fight now went on between the Holy League on the one side and the Politiques, aided by the Huguenots, on the other. Some consider the ten years that followed the death of Charles IX. as the lowest period in the history of the French monarchy. The weak and vicious Henry III. was a mere tool in the hands of the unpatriotic league. It was a time of intrigue, treachery, and partisan warfare. Even the Huguenots seemed to be animated less by religious zeal than by the thirst for plunder and adventure.

Religious Attitude of Henry of Navarre. — Down to 1584 Henry of Navarre showed little of the spirit that afterwards distinguished him. It was doubtful whether he would throw in his lot with the Catholics or the Protestants. It will be remembered that he had married the Catholic Margaret of Valois. On the death of the Duke of Anjou, the younger brother of Henry III., in 1584, Henry of Navarre became heir to the throne. He was now fired by the ambition to

put an end to the disordered state of affairs and become the true king of France.

As to religion, he had little sincere faith, but would not become a Catholic, because it would drive away his friends, and because his first principle was toleration in religious matters, while the strict Catholic party were bent on crushing out heresy completely. His object was to become the head of a national party. His Catholic enemies were bound that he should never come to the throne. Many political pamphlets were circulated discussing the question of royal succession. These put forth the theory that a heretic should never rule, in spite of hereditary claims, and the Jesuits were especially active in pressing this view.

Henry III. and the League. — King Henry III. was in an unfortunate position. He had to choose between joining the Huguenots, whom he hated, and submitting to the league, of which he was jealous; but finally he chose the league, forming a treaty with them in 1585, in which he agreed to repeal the acts of toleration to the Huguenots. Thus he became the head of a faction rather than king of France. The pope excommunicated Henry of Navarre, declaring that he was not a lawful successor of the throne of France and that he was deposed from his throne of Navarre.

War of the Three Henrys. — Thus arose the War of the Three Henrys, as it is called, from the fact that the leaders were Henry of Navarre, Henry III., King of France, and Henry, Duke of Guise. Henry of Navarre soon showed himself a brave and skillful commander by his victory at Coutras, where he defeated an army twice the size of his own. The Duke of Guise, also an able general, won as great a success as this over the Germans, who had sent a force to aid the Huguenots. Guise became an idol of the Catholics. The king was a nobody and was distrusted by the strict Catholic party.

Assassination of Guise. — The Parisians invited Guise to come to the city, and the king, much against his will, was made to

appoint his rival lieutenant general of the kingdom. But in revenge he soon afterwards caused the assassination of Henry of Guise and his brother, the cardinal. This involved the king in a war with the league and so drove him to the side of Henry of Navarre. The king promised to grant toleration to the reformed faith, and Henry of Navarre in return declared himself loyal to the crown. The Huguenots and the Politiques now rallied around the throne, and things looked promising for the return of permanent peace.

Murder of Henry III. — But the Leaguers were desperate, and set on foot plots for the assassination of the renegade king. One Jacques Clément, a half-crazy fanatic who had brooded over the downfall of the league, planned to murder the king, having first been told that such an act, while irregular, was not a mortal sin. Securing an interview with the king at St. Cloud, he suddenly stabbed him (1589). On his deathbed Henry III. enjoined his nobles to do their duty toward Henry of Navarre as their rightful king.

Battle of Ivry. — Henry was perfectly willing to guarantee the security of the Catholic faith, but this was not enough for the league, which declared the Cardinal of Bourbon king of France. Philip II. of Spain, who was trying to secure influence over the Catholic countries of Europe, sent aid to the Leaguers, and on the other hand Henry received some auxiliaries from Elizabeth of England. The great battle of the war was the battle of Ivry, in 1590, where the Leaguers and their Spanish allies were completely routed, large numbers being slain and the rest scattered in all directions, leaving their cannon and standards in the hands of the victors. Henry's success was now only a matter of time.

Henry's Conversion. — In 1593 Henry turned Catholic. He was moved to do this by considerations of policy, for a Protestant on the throne of France would never have received the loyalty of his subjects. He could not hope to be a truly national king if he remained identified with the Protestant cause. Moreover, his conscience in religious matters had al-

ways been somewhat lax. His faith was never strong, and he is said, when the subject of his conversion arose, to have remarked that a kingdom was well worth the price of a mass. His abjuration of the Protestant faith has always been blamed, but though it reflects no credit on his character, it prepared the way for the return of peace and good order in France.

Close of the War. — The war continued several years after the battle of Ivry, but now that the king had joined the Roman Catholic Church there was a large party in France which favored loyalty and longed for the return of peace. The league began to lose ground, but the war with Spain went on. In 1597, however, Henry made a vigorous campaign, as a result of which Philip II. offered terms of peace. By these he recognized Henry IV. as the rightful king of France, and there was a mutual restoration of the places taken during the war. This was the Treaty of Vervins (1598). The long period of religious wars in France was now at an end.

The Edict of Nantes. — Though Henry had withdrawn from the Huguenot party, he had no intention of allowing the return of the old persecutions. As soon as he had secured himself on the throne and brought his wars to an end, he issued the famous Edict of Nantes (1598). By this decree the Huguenots received practical liberty of worship. They were admitted to offices on an equal footing with Catholics, and they were allowed to retain the cities which they had garrisoned. They did not gain by this complete religious liberty, because they were not free to worship in all parts of the country. They became a distinct party having ample means of self-defense, but without much prospect of progress. The Edict of Nantes was a wise and humane measure, and it remained in force for nearly one hundred years.

Henry's Government. — Henry's private morals were lax. He was self-indulgent and dissipated, but as a ruler he was one of the best that ever occupied the throne of France. No prince ever had the interest of his subjects more at heart. He found the country in a wretched condition, the lands desolated, and

the people impoverished by the long wars. The finances were in confusion, and the revenues were collected by untrustworthy agents who had absorbed a large part of what should have been given to the treasury. He placed the management of internal

FEEDING THE POOR. (Sixteenth Century)

affairs in the hands of a singularly able minister named Sully, whose economy and skill soon brought a revival of trade and industries, and an increase of the revenues. Roads and canals were completed, commerce was promoted, colonies were sent out, a postal system was established, and everywhere there was evidence of prosperity. But before Henry had time to carry out all his plans for the improvement of France, he was cut down by an assassin. A fanatic named Ravaillac, feeling that he was ridding the Church of its worst enemy, stabbed the king in 1610.

CHAPTER LIII

THE THIRTY YEARS' WAR

The Thirty Years' War. — The Thirty Years' War began in 1618 and was closed by the Peace of Westphalia in 1648. During this time the states of Germany, where the war was for the most part carried on, were the scene of sieges, battles, and all the horrors of war. The war took on in its later years a European character and all the great powers were engaged. It was the last great struggle for power between the religious sects.

Causes. — Besides the natural antagonism between the Catholics and the Protestants, there was a special aggravation of

religious hatred in the clause of the Peace of Augsburg called the Ecclesiastical Reservation. In this, as we have seen, it was provided that any ecclesiastical prince on turning Protestant must give up the lands and authority pertaining to the office. The treaty as a whole was not satisfactory to either Protestants or Catholics, and this clause seemed especially unjust to the Protestants, who in many cases disregarded it and retained the ecclesiastical property which by the terms of the law should have been given over to the Catholics. Many of the Catholic bishoprics in the northern part of Germany were retained by Protestants.

The Evangelical Union. — The emperors Ferdinand I. (1555–1564) and Maximilian II. (1564–1576) were tolerant rulers and did not persecute the Protestants. During their reigns, therefore, the Protestant faith made rapid progress. But on the accession of Rudolph II. (1576–1612) the imperial policy was changed, as he was an intolerant devotee to Catholic interests. In Austria he used harsh measures against the Protestants, and in 1607 the Catholic Duke of Bavaria seized the free Protestant city of Donauworth and brought it directly under his own rule. The Protestants throughout Germany were alarmed, and in 1608 they formed the Evangelical Union, a league of defense like the older League of Smalkald. The Union, however, did not comprise all the Protestant states.

Periods of the War. — There were three periods or stages in the Thirty Years' War. The first was the period of the Bohemian struggle, from 1618 to 1629. The second stage of the war, from 1629 to 1632, was marked by the interference of Sweden, under the leadership of the brave king, Gustavus Adolphus. The third and closing period was from 1632 to 1648. At this stage France, as well as Sweden, took part in the struggle, which now was waged for political objects and territorial gains as much as for religious ends.

The Bohemian Period. — The oppressions of Ferdinand II. of Bohemia led the Protestants of that state to revolt. They appealed to the emperor in vain, and in their anger at his

neglect of their demands they went to Prague, entered the royal castle there, and threw two of the imperial advisers out of the window. The war began in 1618. The Bohemian king, Ferdinand, soon after the opening of the war, was chosen emperor of Germany. Backed by the Catholic or Holy League, which was formed in 1609 as an offset to the Evangelical Union, and receiving aid from other sources as well, he was by far the stronger party. The Protestants hoped to obtain aid from James I. of England and his son-in-law Frederick V., who was chosen by the Bohemians as their king; but in this they were disappointed, and Ferdinand, invading Bohemia, quickly crushed out the Protestant revolt. The Bohemian king, Frederick V., now became a fugitive, and Denmark, England, and Holland took his part.

Tilly and Wallenstein. — The chief leaders of the Protestants were Christian IV., king of Denmark, Count Mansfeld, and Christian of Anhalt. Of the Catholics the two great generals were Tilly, who commanded the force of the Holy League, and Wallenstein, who led the imperial army. Wallenstein was by far the most successful general in the early period of the war. He was a Bohemian noble of great ambition and energy, but as unscrupulous as he was brilliant. He collected an army at his own cost and his plan was that the army should support itself by plunder. This plan of a self-supporting army relieved the imperial treasury, but resulted in a ruthless destruction of property; for the troops devastated the country they passed through and on conquering a city gave themselves up to every kind of violence and excess.

The Protestants were worsted in almost every encounter; for they had no one to compare in ability with the Catholic generals. Wallenstein overthrew the Protestants under Mansfeld at Dessau, and Tilly defeated Christian of Denmark at Lutter. The Protestant states were overrun by imperial armies; their cities were seized, and several of the members of their league were forced to join the Catholics.

Edict of Restitution. — Peace was finally formed at Lübeck (1629), and the emperor tried to settle the status of the two parties by the Edict of Restitution, issued in the same year. This gave back to the Catholics the lands which they claimed were theirs in accordance with the Peace of Augsburg. As a consequence, it dispossessed many of the Protestant ecclesiastics, and its harshness was such that the Protestants were bound to oppose it and renew the war.

Second Period of the War (1629–1632). — The central figure of this second period of the Thirty Years' War was Gustavus Adolphus of Sweden, a man of great strength and sincerity of character and remarkable military skill. Just at the time when this new foe was preparing to attack them, the Catholics lost the service of their ablest leader. Wallenstein, having incurred the jealousy of Ferdinand, as well as the hatred of the people, on account of the outrages committed by his troops, was forced to leave the service of the emperor. Many of his troops and officers retired with him; the rest joined the imperial army, under the command of Tilly.

Gustavus Adolphus in Germany. — Gustavus Adolphus entered Germany at the head of 16,000 men. Among some of the Protestants there was a reluctance to coöperate with this new ally; for they distrusted his motives, especially in regard to northern Germany, where it was known that he had dreams of making himself the master of the Baltic Sea. Nevertheless, many of the hesitating Protestants rallied to his side after the siege and sack of Magdeburg, in 1631. The taking of this city by the troops of Tilly was marked by the most brutal massacre and pillage. Women and children were murdered,

GUSTAVUS ADOLPHUS

and the town was burned to the ground. It is said that some 30,000 people perished at this time.

Saxony now joined the side of the Swedish king, who, in 1631, encountered Tilly on the battlefield of Leipzig. Here Gustavus completely overthrew his enemy, and when Tilly again tried to check his advance into southern Germany, Gustavus won another battle, in which Tilly was slain. The successes of Gustavus led the emperor to restore Wallenstein to the command (1632), and Wallenstein accepted the leadership on condition that he was to have absolute control of the army.

Battle of Lützen. — The next great event of the war was the battle of Lützen (1632). Wallenstein, having quickly gathered a large army, drove the Saxon invaders from Bohemia and himself invaded Saxony, where on the field of Lützen he joined battle with the Swedes. Again Gustavus Adolphus won the fight, but fell at the moment of victory. His death was the severest loss that the Protestants sustained during the war, for he was by far the most skillful of their leaders. As a result of this second period of the war, the advantage was mainly on the side of the Protestants.

Third Stage of the War (1632-1648). — Wallenstein, though he had been reinstated, was still an object of suspicion to the emperor. He was thought to be aiming at the crown of Bohemia, and to be in secret communication with the Protestants. Ferdinand ordered him to be arrested as a traitor. His agents dared not do this openly, but treacherously attacked him and put him to death (1634).

In this third period of the war France played a part. Richelieu was now directing the policy of the French throne, and his policy had for its main aim in foreign affairs the increase of the power of France, and the humbling of the house of Austria. Sweden continued to take the part of the Protestants, and the war became a conflict between the German Empire on the one hand and France and Sweden on the other, rather than a mere contest between the states of Germany for religious mastery.

Treaty of Westphalia (1648). — When all parties to the struggle were exhausted, overtures were made for peace, which was formed by the Treaty of Westphalia in 1648. This treaty had a twofold character. In the first place it pronounced upon the religious question, and in the second place it settled territorial boundaries and political control.

Religious Provisions. — As to the religious provisions of the treaty, they recognized three forms of religious belief; namely, the Catholic, Lutheran, and Calvinistic. These were placed upon the same footing. The religion of a state was still to be the religion of its prince, and he had the right of banishing those of another faith, but it was required that he should first give them three years' notice before expelling them from the country. Substantially it gave the three religious parties civil equality and religious freedom. In respect to the point of dispute in the Treaty of Augsburg, it was agreed that the Protestants should keep all the church property which they had possessed in the year 1624.

Territorial Provisions. — The provisions of the treaty which related to territorial boundaries were perhaps even more important. France gained the greater part of Alsace and three cities in Lorraine. The independence of Switzerland and also of Holland was formally acknowledged. Sweden acquired a long strip along the Baltic coast of northern Germany. The German states themselves underwent many important changes in territorial lines, and their relations to the imperial authority were materially changed. They could enter into alliances with one another and with foreign powers, and the Diet had the right to decide upon all important measures. Thus Germany became a bundle of virtually independent states, and no real power was left to the emperor.

Importance of the Treaty of Westphalia. — The Treaty of Westphalia was one of the chief international compacts in the history of Europe, and its effect has been felt in European affairs almost down to our own times. As a result of it, France gained some of the objects of her ambition. She was

now started on a path of aggrandizement, which soon gained for her the foremost place in Europe. Her possession of Alsace and Lorraine, a region occupied by people of German blood, continued down to 1871, when Germany regained these territories as a result of the Franco-German War. In northern Europe, Sweden became the leading state. Sweden, by acquiring German territories, had the right of representation in the German Diet, and France also could interfere in German affairs as the guarantor of the treaty.

On its religious side the Treaty of Westphalia, being of the nature of a compromise, did not go far enough to satisfy either party. It did not definitely declare the principle of perfect toleration, yet it prepared the way for the triumph of that principle by recognizing Calvinism as a legitimate form of belief and by protecting the subject against the religious persecution of his prince.

To sum up, France and Sweden came forward in European politics, while Germany and Spain fell far behind; Germany found her central government weakened and her internal affairs in confusion; Protestantism had gained recognition, and the period of warfare between nations for religion's sake came to an end. These were the main results of the Treaty of Westphalia.

Effects of the War. — As a result of the war, Germany was left in a condition of indescribable wretchedness. The people had been at the mercy of plundering armies for many years; their lands were turned into deserts and their cities were reduced to ashes. It is said that the population of the whole country fell off more than one half during the war; that in the city of Augsburg the population decreased from 80,000 to 18,000; and that the duchy of Würtemberg fell off in population from about 400,000 to 50,000. Learning was checked and vice and crime increased. In fact, the civilization of Germany was set back many years and it required the lapse of a long period before she regained what she had lost.

CHAPTER LIV

THE GROWTH OF NATIONS — THE ASCENDENCY OF FRANCE

Louis XIII. — The death of Henry IV. left his son Louis XIII., a child of nine years, on the throne, and the government was carried on by the queen mother, Mary de' Medici. Louis XIII.'s reign lasted from 1610 to 1643. During the early part of his reign affairs were ill managed, for the queen had little ability as a ruler; but after the year 1624 the policy of France was directed by one of the ablest statesmen of the century, Cardinal Richelieu. The king himself had neither the taste nor the ability for government, and left affairs in the hands of his minister.

Richelieu. — The object of Richelieu's policy in domestic affairs was to make the French king absolute, and in foreign affairs to make France the most powerful state in Europe.

To attain the first of these objects, he resorted to every means to break the power of the aristocracy and to crush the Huguenots. In both these points he was successful. The authority was gained for the king at the expense of the nobles, and the Huguenots as a political party were destroyed. They had formed a sort of state within a state, having totally different objects and ambitions from the people of the rest of France. They would have liked to form in France an independent Protestant commonwealth — a project wholly inconsistent with national unity and greatness.

Siege of La Rochelle. — In 1627 an English fleet appeared off the coast of France to give aid to the Huguenots, an alliance having been formed between the Protestant nobles and the English crown. The chief city of the Huguenots, and the one which they designed for the capital of their proposed republic, was La Rochelle. Richelieu took vigorous measures against the Huguenots, and commanded in person at the siege of La Rochelle. After a long and courageous resistance, in the course of which the population fell to a small fraction of what it had been, the city yielded and its fortifications were destroyed. In a short time the Huguenots were deprived of all political power, although they were allowed to retain the measure of religious liberty which they had previously possessed.

How Richelieu carried out his foreign policy of making France the greatest state of Europe, we have seen in describing the closing period of the 'Thirty Years' War. Richelieu died before the war ended, but France reaped the benefit of his policy.

The Age of Louis XIV. — During the reign of Louis XIV., the son and successor of Louis XIII. (1643–1715), which lasted over seventy years, France was the leading nation of Europe. In some respects it was a brilliant period. The magnificence of the French court, the splendor of Paris, and the proud position of France in Europe were characteristics of the time. Literature flourished under the patronage of the court, and

some of the greatest of the French writers lived in this reign. A striking characteristic of the time was the absolute belief of the subjects in the divine power of the king. Louis XIV. was the most conspicuous type of an absolute monarch. He was the source of all power and glory.

Cardinal Mazarin. — The king was a child five years of age when he came to the throne, and during his minority the government was carried on by Mazarin. What Richelieu had undertaken, Mazarin carried out. The great advantages which France won by the Treaty of Westphalia were due to him. Richelieu did not live to see Spain and the German empire humiliated, but in Mazarin's time they were no longer the leading powers. The eighteen years of his premiership were one of the most brilliant periods in French history, and much of what was gained after him must be set down to his credit; for some of Louis's greatest ministers were trained in politics by Mazarin. He died in 1661, leaving Louis a singularly able adviser in the minister Colbert.

LOUIS XIV

Colbert. — On the death of Mazarin, Louis, declaring that he would be his own prime minister, assumed the control of the government. He did, in fact, keep a sharp watch on every department of affairs. Some regarded the king's declaration as a joke, thinking that he would soon tire of busying himself with affairs of state.

Among those who did not appreciate the king's earnestness in this matter was the minister of finance, Fouquet, but he soon had cause to regret his blunder. Fouquet had managed the finances in such a way that at the end of his term of office he was enormously rich and the finances were in a worse con-

dition than they had been before. His display aroused the jealousy of Louis, who, in the first place, disliked to see one of his subjects living in a state more luxurious than his own, and, in the second place, viewed with distrust wealth which was acquired from any other source than the king's liberality. In a financial report, Fouquet falsified some of his accounts, thinking it would probably escape the king's notice, but the matter was brought by Colbert to Louis' attention and Fouquet was promptly degraded and condemned to imprisonment for life.

Colbert was one of the ablest finance ministers in French history. From 1661 to 1683 he was at the head of the French finances, and during this period he managed to remove abuses and increase the revenue to an enormous extent. His policy, too, was one of encouragement to internal trade and agriculture.

Wars of Louis XIV. — There were four principal wars during the reign of Louis XIV. They were, first, the War with Spain, which arose over the question of the Spanish Netherlands (1667-1668); second, the War with Holland (1672-1678); third, the War of the Palatinate (1689-1697), and fourth, the War of the Spanish Succession (1701-1714). In all of these wars France was the aggressor, and the object was conquest and the acquisition of new territory.

The War with Spain (1667-1668). — This arose from the alleged claims of Louis' queen, Mari'a There'sa, to the sovereignty over certain territories in Flanders and Brabant. She had renounced this claim on condition that a certain sum of money should be paid for her dowry. Spain had not paid the dowry, and this was taken by Louis as a justification for the renewal of his wife's claim.

Louis' argument was not the most reasonable or moral one, but it was backed by superior force. Spain was weak in many respects, and he was ready to take the field with a strong force under Turenne, the ablest general of the time. He invaded the low countries and took several important cities. The pompous vanity of the king is illustrated by what has been called "his tranquil siege of cities." Without incurring any

danger, he would be present with his court at the siege and on capturing the town he would be straightway hailed as a hero surpassing the great generals of antiquity.

Treaty of Aix-la-Chapelle (1668). — Holland, taking alarm at the invasion of the Spanish Netherlands, brought about a triple alliance between Sweden, England, and herself, which demanded that peace should be restored. Louis very reluctantly gave way and consented to the Treaty of Aix-la-Chapelle, by which he retained a small part of the low countries.

The War with Holland (1672-1678). — This war was one of revenge; for Louis could not forgive the Dutch for their interference with his schemes in the Netherlands, and still less for the ridicule which some of their writers had heaped on him. Before entering on this war, he tried to isolate Holland and make sure that no ally among the European powers should come to her aid. For this purpose he bought up the Swedish king, and induced Charles II. of England by bribery, to form a secret treaty with him. This Treaty of Dover (1670) was a disgraceful compromise on the part of the English king; for it granted the payment of a large sum of money for a purpose which the people and Parliament of the realm held in the utmost detestation. Moreover, by it the king of England agreed to become a Catholic. The military arrangements were made with equal care, under the skillful direction of Louvois and the famous engineer Vauban.

Louis' success was prompt and complete. The States-General of Holland offered him nearly a third of their territory and the payment of a large indemnity; but the French, foolishly rejecting these terms, demanded more concessions. They required double the indemnity, a larger cession of territory, freedom of worship for Catholics in the Dutch dominions, and the sending of a solemn deputation from Holland each year, to thank the French king for having restored peace to their country.

This was too much even for a defeated and dispirited nation to bear, and it drove the Dutch to a last desperate measure.

They cut the dikes and flooded the country. The French had to give up the siege of Amsterdam. Elsewhere, however, they avenged themselves by acts of cruelty. "The soldiers roasted all the Dutch in the village of Swammerdam," wrote one of the French generals; "they did not let one escape." But finally the Germans sent aid to the Dutch, and England made peace with them. Spain, fearing Louis' ambition, also took sides with Holland; so Louis now had to face a powerful alliance of three countries, Spain, Germany, and Holland.

William of Orange. — The leader of the Dutch was William, Prince of Orange, a descendant of William the Silent. All thought of compromise with France was now at an end, for William was a bitter and implacable hater of the French. He had all the energy and steadiness of purpose that had distinguished his great ancestor, and like him he gained more by patience and persistency than by success in the field. In fact it is said of him that he lost more battles than any other general of history, within an equal period of time. But he would not yield.

Treaty of Nimwegen. — The war closed with the Treaty of Nimwegen (1678), by which the Dutch gave up some unimportant foreign possessions, and Spain the large tract known as Franche-Comté, together with many important cities in Flanders. Holland was saved. The treaty gave her very different terms from what she would have had to concede if the greed of the French in her moment of defeat had not forced her to renew the war. Yet, on the whole, France came out well. Her boundaries in the north became what they are to-day, and her gains at the expense of Spain were permanent and valuable. This date, 1678, marks the highest point which Louis' power attained.

The Interval of Peace. — In defiance of right and in the face of a powerful alliance against her, France had profited from the war, and the credit of it all was given to the king, who now received from his subjects the title of the Great. The Grand Monarch, as he was called, improved the interval of peace by

seizing the territories of his neighbors and destroying the religious liberty of his Huguenot subjects. Success made him arrogant and contemptuous of the rights of others. He seized the important city of Strassburg, humbled Genoa for failing to render prompt obedience to his will, and sent an army to plunder the territories of the Duke of Savoy, because he would not expel heretics from his dominions. In short, he acted as the tyrant of Europe, and before long the other sovereigns formed a league against him. At home, in dealing with the Huguenots, he could act with impunity. They were weak, and the majority of the people were abject in their loyalty.

Measures against the Huguenots.—After the war with Holland the activity of the government against the Protestants increased. Louis had always been anxious to uproot heresy, and the older he grew the more bigoted he became. All sorts of devices were employed to convert the Huguenots to the Catholic faith. The nobility were tempted to renounce Protestantism as the price of the king's favor, and many of them turned Catholics. A large sum of money was set apart for religious bribery; and while inducements were offered for conversion, penalties were multiplied for the obstinate. Every kind of restriction and annoyance was imposed on the Huguenots, and when these failed stronger measures were employed.

COSTUME OF THE TIME OF LOUIS XIV.

The Dragonnades.—One of the harshest features of this coercive policy was the practice of billeting troops in Protestant families. This kind of persecution was known as the Dragonnades. In the families of unconverted Huguenots bands of brutal soldiers were quartered, and the violence and excesses

of these unwelcome boarders were encouraged by the local authorities as likely to drive the unbelievers into the orthodox faith. This, in fact, was their effect. Conversions were quick, if not lasting.

Revocation of the Edict of Nantes. — Finally came the Revocation of the Edict of Nantes (1685), the decree which, it will be remembered, was issued by Henry IV. in 1598, and guaranteed to the Protestants a fair degree of toleration. Its repeal left them no religious liberty whatever. As a matter of fact, great numbers of the Protestants had left the country already. Others followed, till the number of Huguenot refugees reached nearly 250,000. They went to Germany, Holland, Switzerland, England, and the American colonies. As they were among the best and most industrious citizens of France, she suffered by their loss, and the lands to which they went profited to an equal degree.

By revoking the Edict of Nantes Louis made all the Protestant states of Europe his enemies, and by seizing the lands of his neighbors he angered the Catholic powers. As a result, the League of Augsburg was formed in 1686, comprising Germany, Spain, Holland, and Sweden, and later Savoy and England also. In 1688 James II., a Catholic and an ally of Louis, was driven from the English throne, and the Protestant William of Orange was accepted by the English as their king. This was a severe blow to Louis; for he was now liable to attack from the sea, and was obliged to maintain armies and fleets to defend his rear, while directing campaigns on the continent.

War of the Palatinate (1689-1697). — The causes of the war were (1) a disputed claim to the Palatinate, (2) the refusal of the pope to regard Louis' wishes in appointing a new elector of Cologne. The lands of the elector adjoined Alsace, which was endangered by the presence of a hostile neighbor. Hostilities began in 1689. Louis at once threw an army into the Palatinate, and the campaign that followed became a mere raid of murder and pillage. Dwellings were fired, the country was turned into a desert, and 100,000 of the inhabitants are said to

have been driven from their homes. The blame for this brutality attaches mainly to Louis' able war minister, Louvois, the organizer of the Dragonnades. France lost more than she gained by it, for all Europe was indignant at the outrage. In the war the French forces fought brilliantly on land and sea, winning many victories, especially through the skill of their great leader, Luxembourg.

Treaty of Ryswick. — Nevertheless, the alliance of the foreign powers was too strong for them, and the Treaty of Ryswick, which concluded the war in 1697, left France but little better off than she had been just after the Peace of Nimwegen. With the important exception of Strassburg, she gave up almost all the lands which she had seized during the years that followed the war with Holland. Louis recognized William III. as the rightful king of England. The Duke of Savoy, whose family for years had been bullied by the French court, gained a position of independence and became one of the important sovereigns of Europe. From his family descended the kings of Sardinia, who in the nineteenth century united all Italy under their rule.

The War of the Spanish Succession (1701-1714). — One reason which led Louis to consent to the Peace of Ryswick was his interest in the question of the Spanish succession. Charles II. of Spain was childless, and Europe was anxiously debating the question of his successor. There were three claimants in the field: first, Philip of Anjou, the second grandson of Louis XIV.; second, the young prince elector of Bavaria; and third, the archduke Charles, son of the emperor Leopold of Germany.

There was much intriguing and wrangling among the courts on this subject of succession, and several proposals for a fair division of the spoils were discussed. Charles II., finally, resenting the proposed schemes of the great powers for dividing up his inheritance after his death, bequeathed the throne to the weakest of the three claimants, the young prince of Bavaria. This claimant died, however, and France and Austria were the only surviving rivals. Europe was divided on the

question; for it was feared that if either of these great powers gained its end it would create a state so strong that the inhabitants of the others would be threatened. Charles II., a weak-minded and miserable king, finally fell wholly under the influence of France, and in his will named Philip of Anjou as his heir, to the disgust and wrath of Europe. Louis accepted this offer for his grandson. For some time it was doubtful what the course of England would be; but Louis declared the young son of the exiled James II. to be the rightful king of England, in open violation of the Treaty of Ryswick. England was now ready and enthusiastic for war.

Alliance against France. — A grand alliance against France was formed between England, Prussia, Holland, Portugal, the German Empire, and Savoy. Besides the greater strength which their combined wealth and numbers gave, the allies had on their side the military genius of the two great leaders, the Duke of Marlborough and Prince Eugene of Savoy. On the other hand, most of the distinguished French generals had died, and Louis filled their places with men of inferior ability.

Early Battles of the War. — In the first part of the war, the allies were on the whole successful. Marlborough and Prince Eugene defeated the French and Bavarians at Blenheim (1704) on the left bank of the Danube, capturing their general and some 15,000 of their troops. England captured the fortress of Gibraltar in Spain. Marlborough overwhelmed the French again at Ramillies in the Netherlands, and Eugene won equal fame soon afterwards by a victory at Turin. At Oudenarde in the Netherlands the combined forces of Marlborough and Eugene won another victory.

Louis was now (1708) almost without hope. He showed himself ready to make a treaty on terms most favorable to the allies, including even the withdrawal from Spain and the giving up of Strassburg. The allies made the same mistake that Louis had often made in his times of prosperity. They asked too much, and drove the French to renew the war. Another

victory was won by Marlborough and Eugene at Malplaquet, but the situation was now more favorable to France. The archduke Charles, the Austrian claimant, became, by the death of his father and brother, emperor of Germany, and his accession to the Spanish throne was now as objectionable as had been the accession of the French claimant; for it would unite the two great powers, Spain and the German Empire, in the hands of

GIBRALTAR

one ruler. There were, moreover, dissensions among the allies, and their cause was weakened by the distrust aroused by the suspicious conduct of their greatest general, Marlborough, who had entered into negotiations with the enemy.

Treaty of Utrecht. — In 1713 England concluded with France the Treaty of Utrecht. Four other states soon entered into this treaty, and it was followed (1714) by a peace at Rastadt with the German emperor. The terms of the Treaty of Utrecht were by no means so hard for France as would have

been a treaty formed in her hour of distress. The peace left the Bourbon king, Philip of Anjou, on the throne of Spain, but the French court solemnly promised that the two kingdoms should never be united. England gained Gibraltar and the island of Minorca from Spain, and Newfoundland, Nova Scotia, and Hudson Bay Territory from France. Moreover, Louis promised that he would not harbor the Pretender to the English throne (the son of James II.) any longer in his dominions. To Savoy was given the island of Sicily, but this was exchanged a few years later for the island of Sardinia. The Spanish Netherlands, and Naples, Sardinia and Milan were taken from Spain and became vassal states of Austria. The great gainers by the war were England, who in the Treaty of Utrecht gained Gibraltar and some additions to her colonial empire, and Austria, who acquired rich possessions in Italy and the Netherlands.

Close of Louis' Reign. — The last years of Louis' reign were very different from the first. In the most important of his projects he had failed, and even where he succeeded the results did not pay for what it had cost to bring them about. The constant drain on the treasury caused by the continual wars and the absurd extravagance of the French court had almost bankrupted the state. France was in a wretched condition and was beginning to decline from her position as the leading state in Europe. What Louis had gained, he had gained by the devotion of his subjects more than by his own abilities, and the price which France paid for it in the lives and money of her people was too great to be estimated.

CHAPTER LV

ENGLAND IN THE SEVENTEENTH CENTURY—TO THE OUT- BREAK OF THE CIVIL WAR

Introduction.—The seventeenth century was a period of great importance in English history. Before its close, a long struggle between the king and Parliament was brought to an end, and a wholly new principle of government was recognized. The tyranny of the Stuart kings provoked a civil war, and led to the overthrow and execution of Charles I., the second of the dynasty. Then followed a government unlike anything that England had ever before experienced. This was the so-called Commonwealth, which soon fell wholly under the control of the Lord Protector, Oliver Cromwell. In 1660 the Stuarts were restored to the throne, but they had learned nothing from experience. In 1688 the folly and bigotry of the

CORONATION CHAIR
(Westminster Abbey)

Stuart king, James II., caused a revolution. He was driven from the throne and at the will of his people a foreigner was called in to take his place. The Revolution of 1688 changed entirely the system of government, destroying forever the chances of an absolute monarchy in England.

James I. (1603-1625). — The first Stuart to come to the throne of England was James I. He was the son of Mary Queen of Scots, and had inherited the throne of Scotland under the title of James VI. By his accession to the English throne on the death of Queen Elizabeth, in 1603, the two kingdoms were united in the person of their sovereign. In Scotland James had been under Presbyterian influence and the dissenting element in England hoped that he would favor them, but his early contact with Presbyterianism had just the opposite effect. He was a strong believer in the Episcopal form of government, and his motto was "No Bishop, No King"; for he believed that the priesthood of the Anglican Church was the strongest defense of the throne. Accordingly he showed himself indifferent to the Presbyterians from the first. Soon after his arrival in London a number of the Presbyterian clergy presented a petition for a reform in the Church service. James summoned a conference, which decided against them; and ten of the petitioners were thrown into prison.

Besides being intolerant in religious matters, he held to a view in political affairs which was certain to bring him into conflict with Parliament. He believed firmly in the divine right of the monarch, and that all the privileges and liberties of Parliament existed solely by permission of the crown. Had he been a man of marked ability or imposing address, these high notions would not have seemed so absurd; but he was childish, pedantic, and cowardly, with nothing kingly about him, and his claims contrasted strongly with the contempt which his character inspired. He showed at first a tendency to deal gently with the Catholics, but this caused such discontent among his Protestant subjects that his policy changed to one of severity. This led to the formation of the Gunpowder

Plot to blow up the king and the houses of Parliament (1605). But the design was discovered in time, and the conspirators, including Guy Fawkes, who was to have touched a match to the powder which had been placed under the building, were put to death. Still harsher measures were enforced against the Catholics after this.

James and the Parliament. — The king's attempt to rule as an absolute monarch soon brought him into conflict with Parliament. Not content with the usual revenues which were voted him by the Parliament, he imposed certain taxes on his own account, and when Parliament began to debate his right to do this he ordered them to drop the subject. This they refused to do, and the king promptly dissolved the Parliament. The next Parliament met with the same fate, and four of its leaders were thrown into prison. The third Parliament in his reign ventured to protest against his invasion of their rights, but the king dissolved it, and tore the protest from the statute book with his own hand. Thus the first of the Stuarts showed the same disregard of law which later characterized other members of his family.

Other Events of the Reign. — An important event of James' reign was the planting of Scotch and English colonies in the Irish county of Ulster on lands taken from the native chiefs. Many of the Irish were driven from their homes. The Ulster colonies were prosperous, but the natives could not forgive the wrong, and another grievance was added to the long list of injuries which embittered the Irish against their Anglo-Saxon rulers.

In his foreign policy James was wholly unsuccessful. He gave no effectual aid to his son-in-law, Frederick V., who was driven from his Bohemian kingdom, and he planned an alliance with Spain which brought nothing but disaster. Sir Walter Raleigh, who had been kept many years in prison on a charge of treason, was set free that he might go on a voyage in search of gold in America. He found no gold, and on his return planned to seize some Spanish ships. He did not carry out

this project, but the authorities were told of it upon his return, and Raleigh was executed as a traitor.

Charles I. (1625-1649). — Charles I. was a far abler ruler than his father. He was a man of greater courage and more dignity of character, but he had been trained from infancy in the belief of his divine right to rule, and he chose ministers who encouraged him in this view and tried to apply it practically. Parliament was not disposed to be amiable after the wrongs it had suffered at the hands of James. In the first fifteen months of his reign two Parliaments were summoned and angrily dissolved; the first because it demanded that its

CHARLES I.

grievances should be redressed before it granted the king the requisite supplies; the second because it impeached the king's minister, Buckingham. In the interval between the second and third Parliaments the king raised money by forced loans and benevolences, throwing into prison those who refused to comply with the illegal demands. Under the influence of Buckingham the king tried to divert the attention of his subjects from bad government at home by entering into a war with France; but the result was humiliating, and the king's minister was more hated than ever.

The Petition of Right. — Need of money obliged Charles to call his third Parliament, which, before it would grant him supplies, passed the famous Petition of Right, setting forth their grievances. The abuses complained of were illegal exactions of money, arbitrary imprisonment, punishment by martial law, and the quartering of troops in private houses. The petition was drawn up in December, 1628, and the king was obliged to consent to it. It was based on the principles

of the Great Charter, and, like that instrument, became one of the most important elements in the English constitution.

Unfortunately, Charles did not keep his word. He continued to obtain money by illegal means, and to throw into prison those who refused to grant it. When Parliament objected, the king dismissed it. Soon afterwards Buckingham was assassinated, but although this removed one cause of discontent, the Parliament in its next session (1629) was soon at odds with the king again, and came to a speedy end.

Charles rules without a Parliament. — For eleven years, that is, from 1629 to 1640, the king called no Parliament, and ruled as absolute monarch. He threw into prison those members of the House of Commons who had opposed him, and enforced his will through the Court of Star Chamber, which became a very serviceable tool of despotism in his hands. His old illegal methods of getting money were revived, and later a new one was put into practice. This was the collection of 'ship money,' which was originally a contribution from the counties on the seacoast to provide ships for the use of the king. The king, however, had no intention of building a fleet at this time. What he wanted was to raise money on that pretense, and the imposition was levied even on the inland counties. The king was forbidden by law to tax his subjects without the consent of Parliament, but he and his ministers claimed that the levying of ship money was not the imposition of a new tax, but merely the enforcement of an existing law. In the inland counties there was some resistance. The patriot John Hampden ventured to refuse to pay the sum of twenty shillings assessed upon a portion of his estate. This became a test case, and all over England people anxiously awaited the verdict. Hampden lost the case, but the result was to make him the idol of the Parliamentary party, and to add to the unpopularity of the tax.

The King's Policy toward Scotland. — In Elizabeth's reign the Presbyterian form of worship had been established in Scotland. James, knowing something of the temper of his Scotch sub-

jects, had not dared to force the Scottish Church into conformity with the English, although he caused the royal supremacy to be acknowledged in Church matters throughout Scotland, and the free exercise of the Anglican worship to be permitted. Further than this he did not venture, but Charles was not equally cautious. The archbishop of Canterbury was now the energetic but narrow-minded Laud, whose one idea in regard to Scotland was to uproot all dissent from the Anglican Church, and to make the bishops supreme. With his aid, and at Charles' command, a new prayer book was prepared for the Scotch, to their indignation. So, while England was in an uproar over the king's tyranny in political matters, Scotland was on the verge of revolt on account of religious oppression.

The National Covenant. — At last, in 1638, the Scotch people signed the *National Covenant*, promising to adhere to their old religion, and resist all attempts at change. The king was in a dangerous position, for in spite of his illegal exactions he was short of money. He tried to compromise with the Scots, but his offers came too late. His minister, Strafford, led an army north, but his troops were ill disciplined and he dared not risk a battle. A treaty favorable to the Scots was made in 1639.

The Short Parliament. — The king now finding that he could take no step toward vengeance without a grant of supplies, called his fourth Parliament (1640). This is known as the Short Parliament; for, refusing to come to an agreement with the king, it was dissolved after three weeks. For a little while Charles tried to gain his ends without summoning another Parliament, but again failed. His plans against the Scots ended in failure, and as a last resort he summoned Parliament. This was the famous Long Parliament, which for a period of nearly twenty years acted as the national council.

The Long Parliament. — The discontent of the people at the conduct of the king showed itself in the character of the men whom they chose to represent them in this body. The

majority of the members were radicals, who soon passed beyond the point of legal reform and started on a course of revolution. The king had broken the law by invading the rights of Parliament; Parliament now broke the law by invading the rights of the king. Yet at first it contented itself with merely restoring the constitution to its proper place. Some of its good measures were the sweeping away of the arbitrary courts and the prohibition of ship money. It also provided that Parliament should be summoned every third year.

Fall of Strafford. — But in the proceedings against Strafford, the king's minister, its course was illegal. Strafford had been one of the harshest upholders of the principle of divine right. So far as it lay in his power, he had crushed out, even by unscrupulous means, the least show of opposition to the king's arbitrary government. But the charge against him was treason, and his offense did not technically fall under that head. Parliament, however, condemned him to death under a Bill of Attainder, and Charles, although he had sworn never to desert Strafford, signed the death warrant.

The Grand Remonstrance. — The hostility of Parliament increased from day to day. In the first place, its members had no faith in the king's promises, for they had learned that he made them only to deceive. In the second place, the Puritan party, which was bent on the destruction of the Episcopal form of Church government, was constantly growing in strength. At last the majority passed a resolution known as the Grand Remonstrance, appealing to the people for protection and complaining of the policy of the king's friends. The king had tried to prevent the passage of this measure and, failing in this, determined to seize the leaders in the House. On January 4, 1642, he entered the House of Commons at the head of a band of soldiers and demanded the surrender of five of its members, including John Hampden and John Pym, who were among the foremost of the popular leaders. The members were not present and the king retired in anger.

As he left cries of "Privilege!" followed him. This really marks the beginning of the civil war; for although fighting did not actually take place for several months, all hope of a peaceful settlement was from this time at an end.

CHAPTER LVI

THE CIVIL WAR AND THE PROTECTORATE

The Opposing Parties. — The essential points on which the opposing parties differed were the extent of the royal authority and the rights of Parliament. Among the Royalists, or Cavaliers, as they were called, there was an unquestioning faith in the absolute kingship. Among the Parliamentarians or Roundheads (so called because some had close-cropped hair), there was an equally firm belief in the rights of Parliament. Now the first party stood for the doctrine of the divine right of kings and the passive obedience of subjects. This meant that the king's power could not be restricted by any human authority; that he was therefore above all law, and that the duty of

the subject in all conceivable circumstances was to obey him. He might take the property of a subject and imprison him at will, and the king's servants were answerable to no one but himself. Parliament was merely to assist, not to direct him.

On the other hand, the Parliamentary party looked upon the king as having certain defined powers, but limited by the rights of his subjects. They held that law was made by the joint action of Parliament and king, and that the latter had no right to override the law. Parliament alone had the right to grant taxes. It might punish the king's servants. The king had not the right of punishing his subjects, except by due process of law.

These views represent in general the views of each party. But there were many on the side of the king who did not fully approve of his conduct. They had joined him from chivalrous motives, feeling that he was the weaker party and that Parliament had overstepped its authority. On the other hand, among the Parliamentarians there were men of all grades of political views, from those who favored the setting up of a Republic and the destruction of the English Church, to those who merely wished a limited monarchy. The Parliamentarians were also divided in their religious views. The most numerous element among them was the Presbyterian, but the Independents, who wished for complete self-government for each congregation, were growing rapidly in power.

The Beginning of the War. — On August 22, 1642, the royal standard was set up at Nottingham, and all loyal subjects were summoned to the king's support. There had been some attempts at compromise, but the demands of Parliament were excessive. It required the control of the militia and of the Church, and many other rights, which it had not previously possessed. In the earlier battles, the king's party gained several successes, especially where its cavalry came into play. This cavalry was led by the brilliant but imprudent captain Prince Rupert, grandson of James I. At the end of 1643, however, the Scots made common cause with the Roundheads.

Oliver Cromwell ; Marston Moor. — The most remarkable man in either of the two armies was Oliver Cromwell, who took part in the early campaigns as a colonel of cavalry, having raised a regiment of Puritan troops, which came to be known as 'Cromwell's Ironsides.' The regiment was composed of serious and determined men, who were mighty in prayer as well as in battle. None of the vices of the camp were found among them, and they went in to fight singing psalms. They were regarded as invincible and their record during the war seemed to bear out this opinion. In the great battle of Marston Moor, 1644, the Royalists were beaten by the Parliamentarians and the Scots, through the help of this regiment.

Naseby. — The success of Cromwell's discipline and organization now determined the Parliamentarians to model the army anew. This work fell to the lot of the Independents, and Cromwell became the real head of the army. The decisive battle of the war was fought at Naseby in June, 1645, where the Royalists were routed.

Pride's Purge. — The king in 1646 surrendered himself to the Scots, who later gave him up to the English. Now that he was in the hands of the enemy, there was nothing for him to do but submit. If he could have done this gracefully, it might have averted further war and saved his life. But the same old habit of deceit followed him now as it had in the past, and he tried by crooked means to play off one party against the other. There was a long period marked by intrigues and double dealing, and finally there seemed a chance of an agreement between the king and the victorious party, but here again the king's duplicity injured his cause. It was understood that he should be restored on terms favorable to the Independents. But he entered into a secret treaty with the Scotch Presbyterians, who hated the Independents, and the war broke out again. Cromwell, however, soon succeeded in suppressing the revolt. After this the more moderate leaders could not hold the radicals in check and control passed into the hands of the army, who demanded the death of the king. To prevent any opposition

from Parliament, an officer named Pride entered the House of Commons and arrested all the members who were opposed to the designs of the army.

Trial and Execution of the King.—Injustice and wrong stained the triumph of the king's foes just as they had disgraced his own rule in the time of his prosperity. His trial and condemnation were absolutely without show of legality. After Pride's Purge the House became a willing servant of the army. It went on and instituted a high court of justice, before which the king was summoned. Charles behaved with dignity at the trial, refusing to recognize the right of such a tribunal to pronounce judgment. But the sentence was death and it was carried out in a few days, the king showing courage and composure to the end (1649).

The Commonwealth.—A few days after the death of the king the House of Lords was abolished and a new form of government was established, which is known in history as the Commonwealth. What was left of the House of Commons continued in session and a council of state composed of forty-one members carried on the government. But the only man in England fit to rule at this time was Cromwell, and at the end of the year 1653 he was made Lord Protector of the Realm. Before this he had put down the Royalists and Catholics in Ireland with savage cruelty, and had twice defeated the Scotch forces of the young heir to the throne (afterwards Charles II.) in the battles of Dunbar and Worcester. For five years (till his death in 1658)

CROMWELL

Cromwell ruled with all the despotism that had marked the previous reigns. Yet it was a despotism of a different character, for the ruler was a wise and able man.

The Protectorate. — Cromwell's rule was severe, but so long as people obeyed him he was tolerant of differences in faith. Any form of opposition was crushed by him with vigor and he secured at last the complete submission of English, Scotch, and Irish.

His foreign policy was brilliantly successful. Among the nations of Europe England gained a proud position. Holland had already been forced by him to accept terms favorable to the English; for in spite of the early victories of the great Dutch commanders, Van Tromp, De Ruyter, and De Witt, the English fleet, under Admiral Blake, was in the end successful. From Spain he took Jamaica. He interfered on behalf of the Protestants in Piedmont and forced the Duke of Savoy to cease persecuting them. All over Europe England's name was respected, and she regained the place she had held in the time of Elizabeth.

In spite of these successes his rule was a failure; for he left nothing permanent, and did not succeed in founding a dynasty. Englishmen could not forget that his strength depended on the army, and his foreign victories did not lessen the traditional dislike of military control. Moreover, the Puritan faith was not acceptable to the majority of the people. Nevertheless, Cromwell was one of the great men of history. An historical scholar of to-day has called him "the most typical Englishman of his time."

CHAPTER LVII

THE RESTORATION

Richard Cromwell. — Cromwell's son, Richard, succeeded as Protector, but he was a weak man, neither qualified nor disposed to overcome difficulties. It was soon clear that the great mass of the English people wished for the restoration of the Stuart family in the person of Charles Stuart, the son of Charles I. General Monk, who was in command of the troops in Scotland, marched to London and brought about the meeting of a Parliament which declared in favor of Charles. The prince came to England amid general rejoicing. His march to London was like a triumphal procession, for many who had supported the Parliament at first were weary of Puritan rule. There was hardly any sign of opposition to his restoration, and in 1660 he ascended the throne.

Charles II. (1660-1685). — His reign has been described as a period of good laws and bad government; but the good laws came only at intervals, and the bad government was continuous. It was the reign of the man of whom one of his ministers said that "he never said a foolish thing and never did a wise one." Charles replied, according to the story, that his acts were the acts of his ministers, but his words were his own.

The 'Merry Monarch,' as he was called, was good-natured and affable, witty and shrewd, but wholly without principle or wisdom. On his return the Episcopal system was restored and uniformity of worship was enforced. Yet the measures of the early part of the reign were generally mild. Those who had taken part in the rebellion were pardoned, with the exception of certain of the judges and others who had taken an active part in the condemnation of Charles I. Thirteen of these were put to death, and others were imprisoned for life.

Severity towards Dissenters. — The Church was restored and no other was to be tolerated. This was most unjust, for the

Presbyterians had done much to bring about the restoration of the king and certainly deserved something in return. The king favored toleration, but Parliament refused it. It passed laws to enforce uniformity of worship, with the result that about 2000 clergymen were driven from the Established Church. The so-called Conventicle Act made it a criminal offense for people to worship according to any other services than that of the Established Church. The Five-Mile Act forbade every dissenting minister to come within five miles of any locality which sent members to Parliament. Other harsh measures were taken against both Protestants and Catholics, and thousands were thrown into prison. But Charles is not to be blamed for this policy, for he was secretly inclined to the Roman Catholic faith, and it is probable that he would rather have foregone the pleasure of persecuting the Protestants than have imposed similar punishments upon the Roman Catholics.

Foreign Policy of Charles. — The early years of Charles' reign were a period of disaster and disgrace. In 1665 occurred the great plague in London, destroying the lives of nearly 100,000 people. In the next year took place the great fire which reduced the city of London to ashes. In 1667 the Dutch, who were at war with the English, were so contemptuous of the English power that they tried to sail up the Thames and threaten London. The people disliked the Dutch war and welcomed the triple alliance in which England, Holland, and Sweden joined against Louis XIV. But Charles was faithless to his subjects and by the secret Treaty of Dover in 1670 became the ally of Louis. By this disgraceful treaty he agreed to aid Louis in his attack on Holland, in return for which Charles was to receive a large sum of money and the aid of French troops in case there was any resistance to the restoration of the Roman Catholic faith in England.

The 'Popish Plot' (1678). — The English people were loyal to the king, but equally loyal to their Church. They began to suspect that Charles was plotting against the established faith, and when Parliament came together it adopted harsh measures

against the Catholics. The Test Act, passed in 1673, shut out all Nonconformists from office. This was aimed especially against the Roman Catholics, and the hatred of them was increased by the rumor of the 'Popish Plot.' It was reported that the Roman Catholics had planned to assassinate the king and place his brother, the Duke of York (an avowed member of that Church), on the throne. It was further said that a general massacre of Protestants was planned. One of the chief authors of these false accusations was a man named Titus Oates, a scoundrel who aimed merely at enriching himself at the expense of the government. As a result of fraud and popular delusion, Roman Catholics were put to death, and the Parliament tried to pass an act excluding the Duke of York from the throne. To prevent this, the king dissolved the Parliament.

Whigs and Tories.—Petitions now poured in from all parts of the country begging for the summoning of a new Parliament. On the other hand, those who stood by the king declared their abhorrence of this attempt to force the king's hand. From these circumstances the two parties were termed respectively Petitioners and Abhorrrers, names which soon afterwards were changed to Whigs and Tories. These party names lasted in England for many years. Their origin is doubtful, but it is said that the term 'Whigs' had formerly been applied to the Presbyterians of Scotland, who opposed the government, and that 'Tories' was originally the name of the Roman Catholic dissenters who had sought refuge in the Irish bogs. Neither party wished the overthrow of the monarchy. The difference between them was that the Tories thought that the best thing for the country was to strengthen the crown, while the Whigs had their eyes on the welfare of the people. Tories seemed to have a natural prejudice against any change. The Whigs favored change where they thought it meant improvement.

The Habeas Corpus Act.—In 1679 Parliament passed the Habeas Corpus Act, which provided against illegal imprisonment. Any person arrested gained by this act the right to be

brought to trial, or to have it proved that he was legally confined. This was to prevent the exercise of despotic power against the individual citizen.

The Closing Years of the Reign. — The Whigs had gone too far in their attacks on the Catholics, and finally the tide of public opinion turned against them. The charge of plotting against the king was fastened on them, and two eminent Whigs, Lord Russell and Algernon Sidney, were put to death, though probably innocent of any complicity in the plot. The last year of the king's reign marked the triumph of his party and a return almost to an absolute monarchy. He died in 1685, professing the Roman Catholic faith on his deathbed.

CHAPTER LVIII

THE REVOLUTION OF 1688

James II. (1685-1688). — James was a true Stuart. He was determined from the first to rule absolutely and break down the power of Parliament. Besides this, he was a Roman Catholic and bent on the overthrow of the Protestant Church in England. Soon after he came to the throne, the Protestant peasantry in the west of England revolted against him, favoring the claims of the Duke of Monmouth, an illegitimate son of Charles II. This revolt, however, was soon put down, and the triumph of rule there was marked by the severest punishment. The brutal Chief Justice, Jeffreys, was sent into the counties

which had taken part in the revolt to try those accused of treason. The wanton cruelty of Jeffreys and his disregard of all justice and law have given to his circuit the name of the Bloody Assizes. Nevertheless, the people at large had no sympathy with the insurgents, for James had not yet had time to forfeit the loyalty of his subjects.

Arbitrary Conduct of James. — The first Parliament of James' was very docile; in fact, its loyalty almost reached the point of slavishness. But loyalty to the Church was as strong as devotion to the king, who soon entered on a course which turned warm friends into bitter enemies. In the first place, he tried to remove the restraints from the Catholics, and, in violation to the Test Act, to appoint them to public office. The army was officered mainly by Roman Catholics. He now tried to gain power to disregard any law of which he did not approve, and at first was successful. Roman Catholics were appointed to some of the most important offices in the city, and the attempt was made to put the Church equally under their control.

The Declaration of Indulgence. — By the Declaration of Indulgence (1687) the king declared that all the penalties against nonconformists should be at once suspended. The nonconformists included Protestant dissenters from the Anglican Church, as well as Roman Catholics, and the king hoped that the former would come to his support. But the Protestants saw the danger of such a course; for, if the king could sweep away the law in regard to religious matters, why could he not also do so in regard to political matters? What, in fact, was to prevent his being absolute? The king ordered the Declaration of Indulgence to be read from the pulpit of every church. Seven bishops sent in a petition against this command; the king chose to regard this as an insult to the crown, and the seven bishops were imprisoned and afterwards brought to trial. By this time the king's conduct had angered the people and their sympathy was fully with the bishops. The news of their acquittal was received with great rejoicing.

The Revolution of 1688. — James was no longer young, and if the people could have been assured that at his death a Protestant would come to the throne, they might have been willing to endure his tyranny. But a child was born to James by his second wife, Mary of Modena, and this seemed to promise a continuance of Catholic rule. It was finally decided to invite William of Orange (who was a nephew of James) to come to England to take possession of the throne.

Only the blindest folly on the part of the king could have driven his subjects to take this step; for many men who had previously been intensely loyal and believed that "the king can do no wrong" were now his enemies. James seemed to have no idea of the condition of affairs, and he disregarded all warnings. The landing of William of Orange in November, 1688, reduced the king to helplessness. The whole nation was against him, and he fled in despair.

These were the main points of the revolution of 1688, — one of the least violent and most beneficial of all revolutions. The long struggle between the Stuart kings and their subjects came to an end with the triumph of Parliament. This does not mean, however, that the people of England really gained the control of the government. England as a result of the revolution of 1688 was, in fact, under an aristocratic parliamentary government. Only special and privileged classes were represented in the Parliament and the constitution of England did not become in any sense democratic, until the Reform Bill in 1832. The real control of affairs after 1688 was in the hands of Parliament, whose members were chosen by a comparatively small number of electors.

The New Government. — William's title to the throne rested on the Declaration of Right, which, like the Great Charter and the Petition of Right, marks an important stage in the development of the English constitution. This settled the crown on William and his wife, Mary, so long as they should live, and declared that after their death no person who should profess the Roman Catholic faith should ever be king or queen

of England. If such person should assume the throne, the people were straightway released from their allegiance.

Scotland loyally accepted the new government, but in Ireland, where the Catholic party was strong, there was opposition. The supporters of the fugitive king controlled the Irish army, and James determined to gather them in an attempt to regain the throne. The English and Scotch colonists of Ireland offered a brief resistance to the Catholics, and William soon entered the country at the head of a considerable force. The war was decided by the battle of the Boyne in 1690, at which William commanded in person. James was here completely routed and he soon afterwards went back to France.

William and Mary. — William was now secure on the throne, but he found the task of government difficult. This was, in the first place, because he was a foreigner and naturally favored his kinsmen in appointments to office, and, in the second place, because he lacked tact in dealing with his new subjects. Moreover, as time passed, the people forgot the faults of the deposed king and many of them desired the restoration of the Stuarts. Queen Mary, who was by birth a Stuart, being the daughter of James, died in 1694, and the last bond of affection between the Tories and the throne was broken. The part which England took in the War of the Palatinate has been told in the account of Louis XIV.'s reign. William, it will be remembered, was bent on the humiliation of the French, and he sacrificed everything to success in the war with Louis. When the next great war (the War of the Spanish Succession) was impending, William again prepared

WILLIAM OF ORANGE

to fight his old enemy, but died before any decisive result was obtained (1702).

The Act of Settlement (1701). — The purpose of this act was to settle the succession to the English throne. After William, the natural successor was Princess Anne of the Stuart family, daughter of James II., but in default of heirs to her nothing had been provided. The nearest Protestant relative was Sophia, wife of the Elector of Hanover; and on her and her heirs the throne was settled. A still more important point in the Act of Settlement was the assertion of the principle that the king's ministers were responsible to the Parliament; and there were other important provisions guarding the liberties of that body.

Queen Anne; Union of England and Scotland. — The reign of Queen Anne is one of the most glorious in English history, but this luster was due to circumstances rather than to the qualities of the queen. She was not an especially wise woman, but somehow she enjoyed to an unusual degree the devotion of her subjects. This was the time of Marlborough's great victories in the War of the Spanish Succession. In this reign also took place the union of the kingdoms of England and Scotland. Up to this time the two countries had been united merely in the person of the sovereign. Now in 1707 the union was completed, and both countries were represented in one and the same Parliament.

At the beginning of the reign the Tories were in power; but the Whigs soon gained control, and it was under a Whig ministry that most of the great successes in the war were gained. But the Whigs made some fatal mistakes. It was due to their folly that the allies did not accept the terms offered by Louis XIV. — terms which were far more advantageous than those gained after several years more of conflict. This and other blunders gave the power again to the Tories, who favored a policy of peace. The Treaty of Utrecht, concluding the War of the Spanish Succession, was formed in 1713.

Literary Activity of the Reign. — Queen Anne's reign was remarkable, not only for great battles, but for the literary activity of the time. Among the leading authors who flour-

ished during this period were Addison, Swift, Pope, and Defoe. Never before had so much literary talent been employed in the service of politics. Periodicals and pamphlets on political subjects were published in great numbers and circulated extensively. This reign saw the publication of the first daily newspaper in England.

CHAPTER LIX

THE RISE OF PRUSSIA

The Hohenzollerns. — The history of Prussia is bound up with that of the Hohenzollern family, whose descendants occupied the German throne from 1871 to 1918. The first that we hear of this family is back in the times of Charlemagne, when a count belonging to that house was deposed in Bavaria. His descendants, however, were men of ability, and toward the end of the twelfth century the emperor conferred on one of them the government of Nuremberg. After this the family became noted for its wealth, and in the fifteenth century held a position of influence on that account. They loaned the emperor Sigismund (1410–1437) the sum of 400,000 gulden on the security of Brandenburg. The emperor was unable to repay the money, and the Hohenzollerns were thenceforth electors of Brandenburg.

Early History of Prussia. — In Roman times the Borussi or Prussi inhabited the region now known as Prussia. They were a Slavonic tribe and adhered to their pagan worship. It was the aim of the Germans in the eleventh century to Christianize them or drive them out of their land. This task fell to the Teutonic Knights, who, after hard fighting, conquered the territory from Poland (1226), to which it naturally belonged, both from its geographical position and by ties of race. From the latter part of the thirteenth century to the middle of the fifteenth the power of the Teutonic Knights declined, and by the Treaty of Thorn (1466) they were obliged to give up western Prussia to Poland, retaining eastern Prussia merely as a vassal state of the Polish kingdom. Poland was at that time at the height of her power, and the Teutonic Knights feared that eastern Prussia would also be taken from them. They therefore determined to elect as their Grand Master a prince of the house of Brandenburg-Anspach in 1511. This prince was not content with ruling merely as the chief of the Teutonic Knights. He made the succession hereditary in his family, and changed Prussia to a secular dukedom, rendering homage for it to the king of Poland. In 1618, the Brandenburg-Anspach line having become extinct, Prussia passed to the Elector of Brandenburg, who, according to the feudal law, was a vassal of the emperor for Brandenburg and of the king of Poland for Prussia.

The Great Elector (1640-1688). — When the elector Frederick William came into power in 1640, he found a very weak and ill-joined state. It was a mere collection of provinces, differing from one another in laws and separated by foreign territories. Between Brandenburg and his Prussian duchy a strip of Polish Prussia intervened. The great question was how to weld these parts together and become a real ruler.

His first object was to make himself an absolute monarch. To do this, he formed the nucleus of a standing army with a small body of mercenaries and, having force behind him, he gained all the authority in the state. He spent his whole life

either in battle or in preparation for battle. During the **last** period of the 'Thirty Years' War, he maintained an armed neutrality, and at its end gained some territory. In a war between Sweden and Poland he allied himself now with one and now with the other, as best suited the interest of his house, and he gained much by this policy. He encouraged trade, completed roads, welcomed the Huguenots who fled from France, drove the Swedes from Brandenburg, and freed Prussia from the control of Poland. Under his vigorous rule feudalism began to go to pieces and the foundation of the Prussian monarchy was laid.

Frederick III. — The successor of the great elector was Frederick III. (1688–1713), who inherited all the power but not the title of a king. The chief event of his reign was the obtaining of that title. The means by which he secured it was an offer of assistance to the German emperor in the War of the Spanish Succession, on condition that the duchy of Prussia should be raised to the rank of a kingdom. In the year 1701 Frederick was crowned and took his place among the kings of Europe.

Frederick William I. — His successor, Frederick William I., was one of the ablest men of his time. He reigned from 1713 to 1740, and in this interval added vastly to the prosperity and power of the state. The king's methods were peculiar, for he had many oddities of character. A rigid economy was practiced in every department of the government. At a time when the monarchs of Europe were ruining themselves and their people by their senseless extravagance, Frederick William made himself ridiculous by going to the other extreme. On the death of his father he at once dismissed the whole troop of glittering court flunkies, reduced the expenses of his stable, and discarded expensive forms of dress. He believed that the life of every one in the kingdom, from the highest to the lowest, should be governed by strict frugality and industry. He would tolerate no idlers, and went about the streets striking with his cane any one who he thought was not attend-

ing to his business. It is said of him that he even insisted that the apple women should knit at their stands.

He waged war upon periwigs, and wig inspectors pulled off the headgear of the passers-by to see if the government stamp was upon it. No long periwigs were allowed, and the story is told of him that, desiring to rebuke a foreign ambassador who insisted on dressing in the Parisian style, he arrayed the regimental scullions during a grand review in an absurd exaggeration of the ambassador's costume, with periwigs reaching to the knees, and cocked hats three feet in diameter. After this the ambassador adopted a simple dress.

The other monarchs laughed at the Prussian king's parsimony and his queer freaks, but they came to feel that he was worthy of their respect when they saw the result of that parsimony. His fiery temper, close attention to detail, and rugged despotism were accompanied by shrewdness, vigor of action, and a talent for administration. His economy enabled him to keep an army of 70,000 men, the best-drilled force in Europe, and to lay by every year a balance in the royal treasury.

The administration was highly centralized. The king was in fact an autocrat, but he had at heart the welfare of the people. Under him and his successor, Frederick the Great, the absolute monarchy appears in its best and purest form, and Prussia was well on its way towards its position as one of the great modern states.

FREDERICK THE GREAT

Frederick II. (The Great, 1740-1786).—The young Frederick had been brought up in a rough school. His father's strict train-

ing and brutal ways made his life miserable. He could not gratify his taste for study, nor enjoy any liberty of action.

Heavy tasks were imposed upon him and he was scolded and punished for the slightest disobedience. Once he tried to escape, but the attempt failed and his tutor who had aided him was hanged. He himself narrowly escaped execution by the decree of a court-martial. The king's death released him from this tyranny and he now found himself the inheritor of a strong state and a splendid army. He was ambitious of military fame and wished to raise Prussia to the first place among European states.

War of the Austrian Succession (1740-1748). — On the death of the Emperor, Charles VI., his daughter, Maria Theresa, succeeded to the hereditary dominions of the house of Austria, the direct male line having become extinct (1740). The powers of Europe in the compact known as the Pragmatic Sanction had agreed that the Austrian possessions should descend to her. Nevertheless, no sooner had Maria Theresa come to the Austrian throne than there was a scramble for parts of her possessions. Frederick II. demanded Silesia, and the Elector of Bavaria (who was soon elected to the imperial throne as Charles VII.) declared himself the lawful heir to the Austrian dominions. France joined the Bavarians and Queen Maria Theresa was attacked on all sides.

Seizure of Silesia. — Frederick, having defeated the Austrians in 1741, seized the greater part of Silesia. The French and Bavarians invaded the queen's dominions and drove her from part of them. But in her distress she appealed to her Hungarian subjects, and gathered an army which drove out the invaders and captured the Bavarian capital. Frederick, however, retained what he had conquered; for in the Peace of Breslau (1742) she consented to this in order that her hands might be free to deal with her other enemies. She gained the alliance of the English and the Dutch, and in 1743 the allies defeated the French at Dettingen.

The character of the war changed after this; for England had reasons of her own for opposing the French, and now no longer fought as a mere ally of Austria, but headed the league

against France and Spain. Frederick became alarmed at the success of Austria, fearing that Silesia would be taken from him; for he knew that Maria Theresa was bent on the recovery of the lost province. Accordingly he joined the enemies of Austria, and renewed the war. In 1745 the emperor Charles VII. died and the German princes raised Francis, the husband of Maria Theresa, to the imperial throne under the title of Francis I. Having succeeded in this, the queen now determined to regain Silesia, but the military skill of Frederick thwarted her purpose. By the Treaty of Dresden the cession of Silesia to Prussia was confirmed. The war dragged on several years longer, but without any very decisive gains on either side. It was concluded by the Treaty of Aix-la-Chapelle in 1748, which recognized the election of the emperor, and restored most of the conquests made during the war, but left Silesia still in the hands of Prussia.

The Seven Years' War (1756-1763). — During eight years of peace Frederick devoted himself to improving the condition of his country. He perfected the organization of the army, encouraged industry, and added to the wealth of the state. War was bound to return, however; for Maria Theresa could not forget the loss of Silesia, and was continually plotting to form an alliance against him. Russia, whose empress had long been a bitter enemy of Frederick, joined with Austria against him. There was a long period of intrigues between the different courts, but in the end Saxony and France joined the alliance against Frederick. The only power he could count as friendly was England, and England's grievance was against France, not Austria; for strife had arisen over the respective limits of the French and English colonies in America.

Frederick's Successes. — Considering the number and strength of his enemies, Frederick's management of the war during its early phases entitles him to a place among the foremost generals in history. He won his successes by the rapidity with which he struck his blows. He did not wait for an attack,

but took the aggressive, and at the very beginning of the war marched into Saxony and captured its capital. In the next year he gained two great victories at Rossbach and Leuthen. England now sent him money and troops, and in the following year he defeated the Russians at Zorndorf.

Treaty of Paris. — But he could not hold out against such tremendous odds. Fortune turned against him and he was defeated in several battles. England now failed to support him, and it seemed for a time as if there was no way of averting the ruin of his kingdom. In 1760 the Russians captured Berlin, but Frederick still managed to keep up a show of resistance, and in 1762 a lucky circumstance turned events in his favor. The Russian empress died and was succeeded by Peter III., who was heartily in sympathy with Prussia. Russia not only made peace with him, but sent him aid. Finally all the contestants were tired of war and glad to sign a peace. The Treaty of Paris and the Treaty of Hubertsburg brought the war to a close. Prussia retained Silesia. As a result of the war, in spite of the odds against Frederick and the great drain on the resources of his kingdom, Prussia gained an undisputed place among the great powers of Europe.

General Character of the Reign. — Frederick the Great died in 1786. His reign marks the transition from the absolute monarchy to the modern constitutional state. Not that Frederick actually ruled as a constitutional king, for all authority centered in him. But he introduced a complete system of civil liberty, including liberty of the person, of property, and of the press, and he established on a firm basis the principle of liberty of worship. No king before him had ever done so much for the moral and intellectual welfare of the people. The effect of his reign was to raise Prussia to an equal rank with Austria among the German states, and to give her such strength that ultimately, as we shall see, a unification of Germany was brought about under her leadership. The leading state in northern Europe was now no longer Sweden, but Prussia.

 CHAPTER LX

RUSSIA AND SWEDEN

Early History of Russia ; the Mongolian Invasion. — Russia ranked far behind the other European powers in civilization, and was but little influenced by the revival of learning and by that spirit of enterprise in all departments of life which characterized the beginning of the modern age. A Mongolian invasion in the early part of the thirteenth century set Russia fully two hundred years behind the other states of Europe in point of civilization. The Mongols overran a great part of the country, but the little Russian state whose capital was Moscow later made headway against them. The main interest of Russian history during the latter part of the Middle Ages and the early modern period centers in the efforts of this little state to extend its boundaries and repel the Mongols. The energy of the invaders declined after a while, and the Russians gradually won their freedom.

After the middle of the fifteenth century the Muscovite kingdom became strong and united, largely owing to the efforts

of an able ruler, Ivan III. (1462-1505), surnamed the Great, who regained a large part of Russian territory from the Mongols. Another reign of great importance in early Russian history was that of Ivan IV., surnamed the Terrible. Under him the dominions of Russia were extended to the Caspian Sea, the kingdom of Astrakhan was annexed, and western Siberia was conquered.

The Romanoffs. — In 1613 a new dynasty came to the throne of Russia. This was the house of Roma'noff, the members of which held the throne till 1917. Michael, the first of this line, was an able ruler and did much to improve the internal affairs of his kingdom. Under him and his successor the boundaries were enlarged and the condition of the people improved, but the relations of Russia to outside powers did not become important until the accession of Peter the Great (1682).

Peter the Great. — This prince is one of the most extraordinary figures in history. As a boy he showed a great eagerness for knowledge in departments which were not generally attractive to the members of royal families. He cared nothing for books, but took a keen interest in mechanical devices, in carpentering, and especially in the making and sailing of boats. He was impatient of discipline and opposition and showed at an early age serious defects of temper. In fact, except for his restless and inquisitive spirit, there was little about him to suggest the qualities which afterwards made him famous.

PETER THE GREAT

His half-sister, Sophia, plotted against him, and at one time, through a palace revolution, his life was actually endangered. He was obliged to share the throne with his feeble-minded half-

brother, and at first his position was insecure. In 1689, however, Peter, discovering the plots of Sophia, raised a party against her, took the power out of her hands, and shut her up in a convent. Ivan was wholly incompetent to rule, and from this time forth Peter, though now only seventeen years of age, ruled the state.

Development of Naval Power. — Peter's early interest in naval affairs was destined to have an important influence on Russia. One of his strongest ambitions was to make Russia a great naval power, and to accomplish this it was, of course, necessary to extend her limits to the coast. A Swiss adventurer, Lefort, who had traveled much and was able to give Peter information about foreign countries, became the czar's chief favorite. He was a shrewd and able man, and rendered Peter important aid in laying the foundation of the Russian fleet.

Capture of Azov. — At this time Russia was shut out from the Baltic Sea by Sweden and Poland, and from the Black Sea by Turkey, so that the only port which was available for Russia's navy was in the extreme north, the port of Archangel on the White Sea. It was Peter's belief that Russia could not advance in wealth without a more accessible outlet for commerce than this. He declared that water was what he wanted, not land, and he planned first to gain a port on the Black Sea. He sailed down the river Don, and after a long siege captured the city of Azov on the Black Sea. This success was due in part to the aid which Peter had received from Lefort and another of his advisers, a Scotchman named Gordon, in the reorganization of the army.

Peter now gathered in from all parts of Europe skilled artisans, engineers, and architects; and many of the young nobles were sent abroad to be educated, with instructions to pay special attention to the study of naval and military arts.

But Peter was not content with bringing foreigners to Russia; he determined to visit western Europe himself and gratify his curiosity. Accordingly he set out with a large company. Lefort was at the head of the embassy and Peter attended in

the guise of a subordinate official. He visited the Baltic provinces, Germany, and Holland. While in Holland he worked as a common laborer in the shipyards at Zaandam. His curiosity was unbounded and his energy seemed almost superhuman. He acquired a vast amount of information on all practical subjects.

Revolt of the Strelitz. — Peter returned to Russia, to put down the revolt of the imperial bodyguard, known as the Strelitz. For a long time they had shown an insolent spirit and had been too powerful to be disciplined. Revolts had broken out before, and their power was a constant menace to the government. The revolt was quelled without much difficulty, but Peter determined that nothing of the kind should happen again. The whole force was disbanded and the ringleaders were put to death with tortures. It is said that Peter himself cut off the heads of some of the conspirators with his own hand.

Peter's Reforms. — Then followed the introduction of a large number of very important reforms, all for the purpose of making Russia a European state. The peculiarity of the Russian dress was abolished, and the people were required to dress in the manner of the western Europeans. Schools were established, factories completed, a new coinage issued, and the country opened up by roads, canals, and a postal system. The next great event of his reign was the contest with Sweden known as the Great Northern War.

Sweden. — From the time of Gustavus Adolphus, whose brilliant career during the Thirty Years' War has been narrated, Sweden advanced rapidly in power. The internal administration was improved and Swedish armies were successful abroad. At the close of the seventeenth century Sweden was the mistress of the Baltic Sea, and on the southern coast possessed a strip of territory called Pomerania, which from its position naturally belonged to the adjoining German states. She also ruled the eastern coast of the Baltic, cutting off Russia from the sea.

Charles XII. — Sweden reached the height of her power dur-

ing the reign of Charles XII. (1697–1718), a brilliant but eccentric character, who for many years was the most interesting figure in European politics. When he came to the throne, he found his country threatened by an alliance of three sovereigns, — the King of Denmark, Augustus the Strong, Elector of Saxony and King of Poland, and Peter the Great of Russia. Their object was to appropriate the outlying portions of the Swedish territory, which had been gained by the king who had preceded Charles on the throne.

Charles was hardly more than a boy when he was crowned king, but he soon gave proof of remarkable ability. The Danes began the war, but England took the side of Sweden, and William III. sent an English and Dutch fleet to her assistance. Charles, at the head of a small but well-disciplined body of veteran troops, now attacked the Danes and then suddenly turned against the Russian army, which he encountered at Narva in Livonia (1700). There he completely defeated Peter's troops, who were much superior in numbers to his own. Then he routed the Poles and Saxons, and forced his enemies to a peace containing advantageous terms for Sweden. He compelled Augustus the Strong to give up his claim to the Polish crown, which was then bestowed upon an ally of Charles.

While Charles was busy in the south, Peter, having repaired his losses at Narva, began to encroach on the Swedish lands along the Baltic. In that region, on an island at the mouth of the river Neva, he laid the foundation of the city of St. Petersburg (renamed Petrograd in 1914).

The Defeat of Charles XII. — In 1708 Charles invaded Russia and planned to march directly to Moscow. He defeated the czar's troops, but instead of carrying out his project turned into the country of the Cossacks, who were on the point of a revolt against the czar. But little aid came from them, and the Swedes suffered severely from hardships and privations. In 1709 Charles attempted to take the town of Pul'towa, but Peter advanced to its relief and a great battle was fought under its walls, resulting in the complete victory of the Russians.

Charles in Turkey. — This was the turning point in Charles' career. He now fled to Turkey, where he was allowed by the sultan to remain for several years. He spent his time in plotting to bring about a war between Turkey and Russia, and in this he was successful at first. An expedition was sent against Peter, whose army was caught in a trap and seemed on the point of destruction, but was rescued through the diplomacy of Catherine, whom Peter afterwards made his wife. A treaty was concluded by which Peter lost the port of Azov. Being thus shut off from the Black Sea, it was all the more necessary that he should succeed in his schemes to secure the Baltic coast.

The Turks were beginning to find Charles a very troublesome guest and his position was becoming dangerous. He was attacked by the sultan's bodyguard and narrowly escaped death. With a few comrades, he fled in disguise and returned to Sweden. The allies were on the point of renewing the war, but Charles entered into a treaty with Peter which postponed the conflict. His restless spirit, however, involved him in a war with Norway, where he was killed while besieging the fortress of Friedrichshall. Though a brave soldier, Charles was imprudent and foolish. He had not the art of improving an advantage when once gained, and in spite of his victories his reign brought disaster to his country.

The Peace of Nystadt (1721). — The result of the Great Northern War was to break the power of Sweden. Hanover received Bremen and Werden in return for a sum of money paid to Sweden. The Elector of Brandenburg obtained the larger part of Pomerania, thus securing the southern coast of the Baltic.

More important were the gains of Russia. The Peace of Nystadt gave her Livonia, Esthonia, Ingria, and a small part of Finland. In fact, she controlled the eastern shore of the Baltic Sea, thus realizing Peter's ambition to make her a naval power. This fact is of the greatest importance; for not only did the possession of the seacoast give Russia an outlet for her trade, but it brought her into immediate relations with the civilized

states of Europe. It tended to advance her own civilization and at the same time to make her a powerful factor in European politics.

As a result of the Great Northern War, Sweden lost her place as the first of the northern powers. The leading state of the Protestant powers on the continent was now Prussia, while Russia was well started on her way to a position in the front rank of European states.

The Death and Character of Peter the Great.—Peter died in 1725. No king has ever left a deeper or more lasting impression on his country than this remarkable man. He was a good type of the brutal and half-civilized Russian of his day. In his private life he was a mere savage, without human affections and without moral sense. In appearance he was not prepossessing. He was of great size and strength, but suffered from a nervous affection which caused his head to twitch and his features to contort. He cared nothing for cleanliness or propriety in dress and he usually smelt of brandy and vodka. He lost his temper at trifles and thrust about with his sword. He insulted women, beat his friends, and slapped the faces of foreign ambassadors. He murdered a servant with his own hand for some slight negligence, and when traveling in Germany complained because the authorities of a town that he was visiting refused to break some one on the wheel in order that the guest might see how the machine worked. He exclaimed, "What a fuss about the life of a man! Why not take a member of his own suite?"

Among the many illustrations of the brutality of his private life is his treatment of his son Alexis, who had joined a party that was opposed to the czar's policy. Alexis was condemned on the charge of treason, and the cruelty with which he was treated, in order to make him confess, caused his death. Some even think that he was killed directly by the orders of his father.

But with all this Peter had wonderful vigor of mind and a degree of energy which almost surpasses belief. He literally

whipped and browbeat his subjects into some degree of order and decency. By the power of his genius he dragged his countrymen along in the path of civilization. To him modern Russia owes its greatness.

Catherine II. — Under Peter's successors the power of Russia steadily advanced. The most brilliant reign was that of Catherine II., known as Catherine the Great (1762–1796), a woman of many vices, but one of the ablest rulers in history. She enlarged her dominions and carried Russia farther along in the path of improvement. She conquered the Crimea in 1783, thus securing for Russia a footing on the coasts of the Black Sea. Another aim of her policy was the acquisition of Polish territory, and for many years she was concerned in plots and intrigues for this purpose. One of her lovers, named Poniatow'ski, was placed upon the throne of Poland, and the plots which led ultimately to the dismemberment of that unfortunate state were now begun.

Poland. — The feudal system persisted in Poland long after it had disappeared in the neighboring European states. The period of her greatest power was in the thirteenth and fourteenth centuries. In 1386 the important duchy of Lithuania was united with Poland under a common sovereign, but as the feudal government in other states gave place to the stronger and more compact monarchy of the modern period, Poland fell behind. There was no unity in her system of government; the king had but little power, for the Diet, or assembly of feudal lords, could make the laws and in some respects even act as executive. This Diet was a singularly cumbrous instrument. It prevented the king from governing, but could not insure good order itself. By the principle of the *Liberum Veto* a single member could prevent all action on the part of the Diet, and, as might naturally be supposed, this right was frequently exercised.

The Partition of Poland. — When Catherine's lover Stanislas Poniatowski came to the throne, he was obliged to grant civil rights to the non-Catholics, but when he tried to do this, the

people opposed it on the ground that he intended to abolish the Catholic faith. About this time Russia, in a successful war with Turkey, seized the principality of Wallachia and that of Moldavia. Austria regarded this as a menace to her eastern frontier and opposed Russia's retaining them. To buy her off, territory had to be found in some other quarter, and the division of Poland offered a tempting means. The condition of affairs in that kingdom offered an excuse for interference, for the people had risen against the king. By secret treaties between the three eastern powers, Russia, Austria, and Prussia, the first partition of Poland was carried out (1772). Of the three portions taken from Poland Catherine II. gained the largest, Austria the most populous, and Prussia the smallest tract both in extent and in population, but one of great value to the state, since it helped to round out the Prussian dominions.

Second Partition. — There was now some attempt to settle the disordered affairs of Poland. A new constitution was introduced through the influence of Russia, but it worked badly. One party was for it and another against it, and when the latter attempted to overthrow it, the former appealed to Russia for aid. The Polish patriots, under Kosciusko, made a brief but fruitless resistance. They were defeated in the battle of Dubienka, and as a recompense for the trouble which the foreign powers had been put to by this revolt, another partition was made. In this Russia and Prussia took part, and again Russia received the lion's share. The Polish Diet was obliged to consent (June, 1793).

Kosciusko ; the Third Partition. — The third partition resulted from renewed efforts on the part of the patriots to rescue their country. Kosciusko became commander in chief, and the people of Warsaw rose and murdered the Russians there. But the same thing now happened as before: the third and final partition divided what was left of Poland among her three great neighbors. Thus the failure of Poland to work out a suitable political system and make herself a strong and united

state resulted in her overthrow. For centuries she had given no proof of her ability to govern herself well or advance in civilization, and she paid the penalty of this failure by the loss of her national existence (1795). The French Revolution had now begun, and the partition of Poland had an important influence on it; for the absorption of the eastern powers in the scramble for Polish territory diverted their attention from affairs in France.

CHAPTER LXI

ENGLAND IN THE EIGHTEENTH CENTURY

Introduction. — The house of Brunswick, or the Hanoverian dynasty, as it is called, came to the throne of England in 1714 in accordance with the Act of Settlement, which provided that, in default of heirs to William and Mary and Queen Anne, the throne should go to the heirs of the electress, Sophia, of the German principality of Hanover. Thus it came about that England passed under the control of a German house, and down to Queen Victoria's accession to the throne in 1837

the English sovereigns still retained the royal authority in Hanover.

Reign of George I. (1714-1727).—George I. was a narrow-minded and ignorant man, awkward, diffident in manner, and unable to speak the English language. He cared more for his little kingdom of Hanover than for England, and one of the bad results of the introduction of the new dynasty was soon apparent in the embroiling of England in foreign wars.

At the beginning of George's reign the Whigs gained control of the government. The 'Pretender' James, the son of James II., made an attempt to regain the throne of his father, and in 1715 a serious rebellion broke out in Scotland and the north of England. But his party, called the Jacobites, were soon defeated. The Pretender was a man of no ability, and he blundered throughout the campaign. Moreover, the majority of the English people were too much attached to their religion to favor the return of a family which had been so closely identified with the Roman Catholic faith. The fact that the throne was disputed, however, together with the growing dislike which George I.'s character inspired, caused a decline in the views of royal authority which had formerly characterized the Tories. During his reign the old idea of the divine right of the king was on the wane, and royal power became more limited in consequence.

The South Sea Bubble.—During this reign occurred the famous South Sea bubble. The South Sea Company had been formed in 1711 for the purpose of restoring the national credit. It was very successful, and important privileges were granted to the company. It was a time of rash speculation, as is illustrated by the development of Law's Mississippi scheme in France. The South Sea Company bore, in fact, a close resemblance to Law's great venture. Rumors were circulated that Peru was about to cede gold mines of incalculable value to the country, and all sorts of devices were resorted to to raise the price of the stock; thousands took shares in this and

other companies, and the stock rose to a high figure, but suddenly the bubble burst, and the stock became nearly worthless, bringing ruin on the nation (1720).

Walpole. — The people vented their wrath on the ministers, but they made an exception of Sir Robert Walpole, who had continually opposed the South Sea scheme. He came to power with the full confidence of the people, and for the next twenty years was the most prominent figure in English politics. He was not a man of commanding intellect or lofty morals, but he gave England twenty years of unbroken peace and prosperity. He exalted the power of the House of Commons, and he left the Hanoverian dynasty in a condition of security. During the closing years of his reign George I. was completely under his influence.

Reign of George II. (1727–1760). — Like his father, George II. was a man of immoral life, and, like him, too, he fell completely under the influence of Walpole; for although at first the king was prejudiced against him, the minister succeeded in working his way adroitly into the royal favor. The early part of the reign was a period of prosperity.

Walpole's Ministry. — The best feature of Walpole's ministry was its moderation. Large classes in England were hostile to the king, and the country was divided by political and religious strife, but Walpole's moderation and shrewd military policy tended to restore harmony. He tried to steer his course by public opinion, and to avoid stirring up class prejudices; and his policy in general was characterized by sound common sense, especially in financial affairs. He was one of the first English statesmen to use efficient means for the reduction of the public debt, and his success in raising revenue led the king to exclaim "Walpole can make gold from nothing."

On the other hand, he had serious vices. He was coarse and brutal in his talk and sensual in his life. He was the most successful briber in England. He could say with reason that every man had his price, for his experience seemed to bear this out. He reduced corruption to a system and he kept his

majority in Parliament by a judicious outlay of the money. It is said that one million and a half were expended as secret service money during his ministry, and for the greater portion of this he refused to give any account whatever.

Fall of Walpole. — He fell from power on account of his opposition to war. Hostility sprang up between England and Spain over their colonies, and the English people were anxious for war. Walpole fought against this until the popular sentiment became too strong for it and he was obliged to declare war in 1739, but he carried it on sluggishly and without success, and his ministry lost favor. At last the majority of Parliament turned against him and he resigned in 1742.

Closing Years of George II.'s Reign. — England gained very little by this war, nor did she fare any better when she entered the War of the Austrian Succession as the ally of Maria Theresa. The English people felt that their interests were being sacrificed for the sake of Hanover. Loyalty was at a low ebb.

The Young Pretender. — At this time the 'Young Pretender,' grandson of James II., landed in Scotland (1745) with the design of recovering the throne. The lukewarmness of the people on the king's behalf seemed to promise success to this venture. The Pretender made a bold march on London, evading the English armies, and the Londoners were thrown into a panic, but there was dissension in his camp and he had to retreat, and the Duke of Cumberland met him on the field of Culloden and defeated his army with great loss. This put an end forever to the hopes of a restoration of the Stuarts.

Pitt; Capture of Quebec. — Toward the close of George II.'s reign, England's greatest statesman, Pitt the elder, became the chief minister and directed the war with France. This, it will be remembered, was the Seven Years' War in Europe, but the main issue between France and England had to do with the colonial affairs in America. The war was not completed until the next reign, but already England had dealt severe blows to the French power in America. The French were driven into Canada, and in 1759 General Wolfe won his great victory at

Quebec. Storming the heights behind the city, he took up his position on the Plains of Abraham, and on the following day defeated the French in a fierce battle. The English lost their brave general, but a few days later they were in possession of Quebec. By the Treaty of Paris, which ended the war, France lost her American colonies.

George III. (1760-1815). — The first two Hanoverian kings were ignorant of English politics and obliged to rely on their ministers. Moreover, they cared more for Hanover than for England. But George III. had English ideas. He was born and educated in England, and he made up his mind that he would rule in the manner of the old kings. He tried to restore the power of the crown at the expense of Parliament. In private morals and social relations he was better than his predecessors, and his character inspired respect. He had the loftiest ideas of royal dignity, and the greater part of his reign was taken up with the struggles with Parliament. But though he had some good qualities, he was narrow-minded, ill-educated, and imprudent. During the first twenty-four years of his reign he managed to estrange his people, check the prosperity of the nation, and lose forever the American colonies. His reign therefore was disastrous. The details of the struggle with the American colonies and the rise of the United States to the foremost rank among nations do not properly fall within the scope of this work. It is sufficient here to state that by the treaty of 1783 England's control over the thirteen colonies was lost forever.

GEORGE III.

During the latter part of the reign of George III. he was incapacitated for ruling. He was stricken with insanity, and

the government passed into the hands of the prince regent, afterwards George IV. The most interesting side of the reign from the point of view of general history is the relations of England with foreign powers and the part she played in the wars that arose from the French Revolution. Some account of this will be given in the chapters on the French Revolution.

CHAPTER LXII

THE FRENCH REVOLUTION

Introduction. — In the period whose events have just been described the main interest was centered in the rivalry of the European nations. From the close of the Thirty Years' War in 1648 to the latter part of the eighteenth century the external relations of the great powers have been chiefly the subject of discussion. In regard to their internal politics not much has been said except in the case of England, which during the period of civil war and revolution (1640–1688) had undergone important political changes. In the closing years of the eighteenth century France passed through a political convulsion which not only changed completely her form of government and the relation of her social classes, but influenced all the other

nations of Europe and drew them into one of the severest and most protracted struggles that they ever passed through. The Revolutionary Epoch lasted from 1789 to 1815, and it divides itself naturally into two parts: first, the Period of the French Revolution, and second, the Period of the Napoleonic Wars.

France after Louis XIV. — It had long been the policy of the French court to attract the nobility to Paris and to make them mere personal servants of the king. The object was to break down their feudal authority, and, while leaving them in possession of the revenues from their estates, to place the actual government of those estates wholly in the hands of the king's agents. The people did not benefit by this change, for from them was wrung not only the money which was due to their lords, but a sum sufficient to pay the expenses of their government. Louis XIV. left a debt variously estimated at from 2,400,000,000 to 3,500,000,000 francs, and the payment of this enormous obligation was one of the duties devolving upon the government that succeeded him.

France under the Regency. — As Louis XV. was a minor, the administration was placed in the hands of a regent, the Duke of Orleans. The regent showed no wisdom as a ruler, and France was decidedly the worse for his government. He was quite incompetent to deal with the financial question and he adopted schemes which left the country poorer than before.

John Law. — The man who was responsible for the most disastrous experiment that the government of a civilized state ever made in financial affairs was John Law, a Scotch adventurer and gambler. After a period of gay living and reckless gambling in London, he crowned his career by a duel in which he killed his antagonist and which landed him in prison. But he escaped to the continent and continued to frequent the gaming tables, with the result of soon making good his losses. Law's head was full of schemes for making money, and he believed that a very large amount of paper currency could be kept in circulation on the basis of a very small security. The regent of France showed him some favor

and listened to his ingenious proposals looking to the rescue of the government from its financial troubles. In 1716 Law organized a bank, managed it well, and made it popular. The notes of this bank, in fact, stood at a premium over the old government notes. This won the confidence of the government, which in December, 1718, turned Law's bank into a state bank.

Law's Monopolies. — Now Law wished to get possession of the gold and silver in the country and then issue paper money to any amount, but, lest people should come to doubt the value of this paper money, he thought it necessary to create some artificial means to keep the notes in circulation; that is, to prevent their being presented for payment in gold and silver. This artificial means he found in the formation of the so-called Mississippi Company for colonizing the Mississippi valley and developing its resources, and he received from the government a monopoly for this purpose for twenty-five years. All commerce between France and her colony of Louisiana, as well as the absolute title to the territory of that colony, was vested in this company. The wealth of the region was of course large if it could once be developed; for it must be remembered that the colony of Louisiana contained, besides the present state of that name, all of the Mississippi valley, including several of the largest states in our union. To this vast corporation were added the Company of the East Indies and the Company of China; and Law further gained control of the coinage of the precious metals and the collection of the taxes.

As the price of these great concessions, he assumed the public debt, loaning the government the entire amount. Thus the company became the great financial machine of the state. The next thing was to devise a plan for keeping the notes of the bank in circulation. This was done by providing that they should be accepted at a premium over all other forms of currency in the purchase of shares in the company. Thus if a man wished to take part in this great project for making unlimited wealth, he would naturally wish to obtain these notes in order to purchase shares in the company. So if Law could only keep up

the credit of the company, he could issue paper money to his heart's desire.

The Mississippi Bubble. — This was a time of great credulity among all classes of people, and the laws governing money, credit, and trade were little understood. Through John Law's clever management a fever of speculation in Mississippi stock broke out among the people. In 1719 the shares began to go up with amazing rapidity. In the spring of that year the shares were at par; that is to say, they could be purchased for the sum of 500 livres. In the fall their price went up to 5000 livres, and a little later it is said that as much as 20,000 livres was paid for a single share. All classes of society shared in the craze. A valet is said to have become worth 50,000,000 livres; a bootblack 40,000,000, and a restaurant waiter 30,000,000. The word 'millionaire' came now for the first time into use. Many curious tales are told of the sudden gain of private fortunes; of the transition from poverty to vast wealth in a single day; of errand boys sent out by their masters to make a purchase, stopping to speculate in shares with the purchase money and gaining a fortune in a few hours. The government could now make all the money it needed and was relieved from the necessity of taxation.

The Collapse of the Bubble. — But it soon became evident to some wise heads that the company did not really earn money from its plantations and its trade, but that it merely paid out its dividend from the money which was paid in for shares. In other words, it gave back a part of what it received from its customers under the pretense that it was paying something additional from wealth which it had itself gained. These prudent people kept their own counsel and began to hoard gold and silver. The people, seeing the gold and silver disappear, became frightened. Soon the credit of the company began to topple and Law's desperate efforts to restore confidence failed. The collapse was as complete as the inflation. The notes sank in value, and the more they were issued the lower they fell. The government tried to stop their depreciation by a decree

forbidding the use of gold and silver. This only made matters worse. The stock of the Mississippi Company fell in twelve months from forty times its par value to nine per cent. The notes became worthless and two thirds of the paper was suppressed.

Results of the Financial Folly. — The government was deeper than ever in debt and the people became more hostile to it. The property of the country had changed hands, passing, in many instances, from honest but imprudent farmers and artisans to shrewder but less worthy people. The belief that money could be made without work demoralized society. The peasants had flocked to Paris to get rich by speculation, and were left destitute. The whole industrial and commercial life of France was corrupted. The importance of this as bearing on the causes of the French Revolution is very great, for the main thing that drove the people of France to revolt was the government's foolish and injurious financial policy. Following this period of trouble and confusion came the reign of Louis XV., one of the most impotent and disreputable of French kings.

France under Louis XV. (1723-1774). — No king ever came to the throne with a stronger hold on the loyalty of his subjects than Louis XV., and no king ever left it more generally hated or despised. Yet the period of Louis XV.'s reign was not wholly one of humiliation for France. She won some credit by her share in the War of the Polish Succession (1733-1735), and in the War of the Austrian Succession, and by a temporary conquest in India. The result of her long war with England, which came to an end by the Treaty of Paris (1763), was, as we have seen, unfortunate, for it put an end to her power in the Western Hemisphere. Neither the blame nor the credit for her foreign policy, however, belongs to Louis XV., who lived merely for pleasure and had a marked distaste for rule. During the first and best part of his reign affairs were fairly well managed by his minister Fleury, but the later years were filled with failures and national disgrace.

The wars cost France enormous sums and the bad management of her finances reduced her to bankruptcy. All the old-time devotion of the people to the throne disappeared, for no one could long admire a man of Louis' character. The absolute monarchy in France depended for success upon the personal character of the king, and when that character was of a kind to inspire contempt, the whole system was weakened. Louis had no sense of responsibility for this. His only care was that the state should last as long as he did. His successor must look out for himself.

Causes of the Revolution: First, Condition of the People. — Probably the French peasants were no worse off, so far as oppressive government was concerned, than those of other countries, but they felt their burdens more. They were increasing in intelligence and able to appreciate the injustice of their lot. Moreover, the middle class was active and alert. Its members had increased in wealth, and yet were shut out from all political rights. The years just preceding the French Revolution were years of scarcity in parts of France, and the suffering among the lower classes was intense. A fairer adjustment of the burden of taxation would have prevented this, but, as matters stood, wealth was confined largely to the privileged classes, the nobility and clergy, who, while owning the largest share of the property, bore few of the burdens of taxation.

Second, Intellectual Revolt. — The French literature of the last half of the eighteenth century was full of skepticism and speculation. It showed a tendency to break with authority in all departments of thought. Voltaire had attacked creeds and preached the doctrine of perfect freedom of belief. Rousseau wrote that all men were equal, and that the possession of power by a class or a ruler was the result of force and fraud. Montesquieu had reasoned about the functions and proper limitations of governments. On all sides there was a tendency to test everything by reason and to break with tradition. It was a time of free thought and radical sentiments on all sub-

jects, and politics was affected by it in common with the rest. There was great zeal for the improvement of the condition of the people, and much faith in the brotherhood of humanity and the rights of men. People dreamed of a return of a "golden age," in which all men should be equals and brothers. These views found their way even among the lower classes, and were there translated into plans for the immediate bringing about of this glorious state of things.

Third, The American Revolution. — This was, no doubt, an approximate cause for the revolution in France. Some Frenchmen had returned from America, where they saw the successful operation of an economical democratic government which seemed to be a realization of the dreams of men like Rousseau. They wished to see the same state of things in France. Their favorable accounts of American democracy exerted a wide influence, and everywhere men contrasted the government across the sea with that which they knew at home. The result was discontent and a determination to bring about a better condition of affairs.

Louis XVI. — Louis XVI. was a man of good impulses but weak will. He was called upon to face problems which would have puzzled a man of real genius, and he himself lacked even ordinary ability. He distrusted himself and inspired no confidence in others. The first great question he had to deal with was the matter of revenues. In spite of the tremendous burden of taxation, the government was poor and in debt, and the debt was constantly increasing. The only possible remedy was the fair taxation of the classes that had the wealth, namely, the clergy and the nobility, instead of seizing the earnings of the wretched peasantry. In many parts of France the peasantry, after paying their taxes, were left in a condition of absolute destitution.

Louis XVI. allowed his minister, Turgot, the ablest adviser of his time, to fall, because he proposed to tax the class hitherto untaxed. Louis preferred to postpone difficulties rather than to meet them. His minister, Necker, and later his min-

ister, Calonne, followed the plan of raising money without shifting the burden of taxation. For a while all went well, but Calonne's scheme consisted merely in the simple device of borrowing, and at the end of three years he showed an addition of 1,000,000,000 francs to the debt. Then he fell back on the plan proposed by Turgot,—the taxing of the nobility and the clergy. This, of course, was a confession of utter failure, but the king in desperation agreed to it.

The States-General.—Before taxing the clergy and the nobility, however, the king wished to gain the consent of an Assembly of the Notables, but this assembly was composed chiefly of the very classes whom it was designed to tax. Naturally they would not consent, but proceeded to inquire into the conduct of the minister who had dared to make such a proposal. Calonne had to resign his place. The Assembly of the Notables proposed certain measures of relief which were then referred to the Parliament of Paris. The latter body promptly said that the only organ of government entitled to decide the matter was the States-General.

The States-General, comprising the clergy, the nobility, and the Third Estate, the last named being the representatives of the middle class, had not met in France since the year 1614. It was an old established rule of the States-General that the three classes represented in it should each have one vote, voting by orders and not individually. This, of course, would prevent the Third Estate from controlling the action of the body; for, the interests of the clergy and the nobility being the same, these two classes would combine against the former. The States-General met on May 5, 1789, and fell to fighting at once about this method of voting. If the new principle were admitted that each member should have a vote, it was sure to place the Assembly in the control of the party of reform; for the Third Estate numbered about one half of the whole Assembly, and they had many friends among the higher nobility and the lower clergy. There was a sharp debate for many days, but on June 26 the two upper classes gave way. This

turned the old States-General into a body governed by a wholly new principle. It was an action without precedent and in effect revolutionary. The new body was called the National Assembly; when it ultimately assumed the power of making a new constitution for France, it was also called the Constituent (constitution-making) Assembly.

The National Guard. — When the conflict was going on between the classes in the States-General, the king, fearing a revolt, gathered his forces to suppress it. The National Assembly, which had now come into existence, looked upon this act as a threat and demanded that a force should be raised for its defense. A committee of the electors of Paris thereupon created such an organization. It was a militia force of 48,000 men, and received the name of the National Guard. Lafayette was placed in command. This body, being composed of strong sympathizers with the revolution, was destined to play a very important part in the events which followed.

The Years 1788 and 1789. — These were years of bad crops and industrial depression. All efforts to relieve the condition were in vain. Thousands were without means of subsistence, and men roamed about the country in bands, robbing and intimidating citizens. In the provinces the laws were disregarded and the attitude of the people was so threatening that many of the courts dared not punish the offenders. Lawless mobs destroyed the forests, or wandered about forcing people to give them food or money.

In Paris the condition was especially bad. The ignorant, the vicious, and the criminal flocked there in thousands, led by the hope of plunder, public or private. National workshops were set up to keep these dangerous visitors quiet, but half-clad groups of ill-looking men prowled the streets, robbed the shops, and defied the police. When the philosophy of the equality of man reached the minds of the ignorant and the vicious, it was taken by them in a very literal spirit. It meant the right of interference with every act of government, a con-

tempt for law, and the hanging up of suspected enemies at the nearest lamp-post.¹

The Taking of the Bastille (July 14, 1789). — The Parisian mob, not satisfied with the formation of the National Assembly, demanded to be armed in their own defense; and when this was refused, rushed off to seize the store of arms kept in the Hôtel des Invalides. Angered by the report that the guns of the old prison of the Bastille were to be trained on the

TAKING OF THE BASTILLE

people, they suddenly gathered around its walls and began an attack. This ancient prison had been the scene of many oppressions in the past. Its foul dungeons and the sufferings of those who were confined there had made it an object of popular hatred. During Louis XVI.'s reign, however, it had fallen into disuse, and it can not be said that at that time it was

¹ Taine, *History of the French Revolution*.

worse than any other prison. Nevertheless, to the mob it still stood as the symbol of despotism.

The governor of the prison surrendered, but the mob murdered him, together with some others, and carried the heads of their victims on pikes through the streets. The few prisoners that were within were set free. Although there was nothing especially heroic about the taking of the Bastille, the event was of great significance, for it seemed to say that a new age had begun. Throughout Europe it was looked upon as a triumph of the people over despotism, and by the liberals of all countries it was hailed with joy.

The Abolition of Privileges (August 4, 1789). — In the meanwhile the work of reformation in the National Assembly was going on, but before building up the new system it was necessary to pull down the old. The date, August 4, 1789, is memorable in the history of the Revolution. When the session of the Assembly closed late that night, France had undergone a great change. All those privileges of special classes, which had been so detestable to the people, were swept away. Slavery was abolished in all the lands belonging to France. Serfdom and the feudal privileges and authority of the nobles were also done away with, and equality of taxation for all classes was decreed. An enthusiasm for popular rights seized the Assembly, and even nobles vied with each other in renouncing the privileges for which in the past they had fiercely contended. Some who had been carried away by the impulse of the moment repented when it was too late. What had been done endured. The changes, which in other countries were the work of a century, were brought about in France in a single night.

'The Joyous Entry.' — The king and court were still at Versailles, but the friends of the Revolution felt that it would be safer to have them where they could be more closely watched. It was a time of scarcity and people were crying for bread. A court banquet, held at Versailles, was the occasion of some foolish speeches which were taken by the mob as signs of hos-

tility toward the popular cause. It was said that the national emblems were insulted, and that it was planned to restore the king to his former rights. This enraged the mob, and a crowd of rough characters, including many women of the lower classes, went to Versailles and broke into the palace of the royal family, who were saved only by the aid of Lafayette and the National Guard. But the mob, with threats of violence, demanded that the king should go to Paris; and on October 6, 1789, the royal family, in the midst of a swarm of ragged ruffians, proceeded to the city. Soon afterwards the National Assembly was transferred to Paris. The importance of this is that henceforth the king and Assembly were under the watchful eye of the people. Any faltering on the part of either was the signal for threats from without, and the government more and more came under the rule of the mob.

Political Clubs. — The fiercer spirits of the Revolution bound themselves together in political clubs. Of these the chief was the Jacobin Club, which derived its name from its meeting place — a building formerly occupied by the Jacobin monks. Its object was constant agitation for the most radical changes in the government. It had branches all over France, and it became the greatest power in the state. At first it was comparatively moderate, but it finally contained among its members the most violent leaders of the Revolution. Among them was an insignificant little man at whom the other members laughed at first, but who was soon to become the most powerful force in the Revolution. This was Robespierre, the representative of the most radical element in Paris.

Another club was the Cordeliers, which also, curiously enough, was named after an order of monks. The members of this club were thoroughgoing Republicans, content with nothing less than the overthrow of the monarchy. Among their leaders was the great orator, Danton, the brutal and half-crazy Marat, and the vicious and bloodthirsty Hébert, all of whom figured prominently in the events that followed.

Emigration of the Nobles. — After the taking of the Bastile,

the nobles began to leave the country. Among the first to take flight was the king's brother, the Count of Artois, and he was followed by a host of others of lower rank. For this desertion of their country in a time of peril they have been greatly blamed. Their fear was natural in view of the excesses of the revolutionists, but their flight was neither patriotic nor politic. In the first place, it took away what might have been a check on the violence of the new movement, and the Revolution went farther than it might have gone had the nobles remained. This resulted not only from the fact that a conservative influence was withdrawn, but from the policy which the deserters followed in foreign countries. Their constant efforts were directed toward the stirring up of foreign powers against France for the purpose of restoring the king to his former position. Such a course naturally appeared to the progressive party as treasonable. It stung the people to fury and endangered the king, who was constantly suspected of being in communication with the enemies of France.

The King's Attempted Flight. — The king's position had become unendurable. He was a virtual prisoner in Paris, and his friends beyond the borders dared not take any step on his behalf lest it should bring down upon him the anger of the mob. He was exposed to insults and subjected to restraints, and every day the mob was becoming more unmanageable.

At last a plan was formed for the king's escape. Leaving Paris by night, the royal family fled in disguise toward the border, planning to join a body of regular troops that had been appointed to meet them. They had almost gained a place of safety when the postmaster of a little village through which the royal coach was passing recognized the king and reported his discovery to the authorities. Louis was captured at the village of Varennes, June 21, 1791. This unsuccessful attempt at escape made his position worse than ever, for thenceforth he was more vigilantly guarded and his every act was viewed with suspicion.

The New Constitution. — The National Assembly came to an

end on September 30, 1791. It is important to see what it had accomplished. In the early part of its session its work was, on the whole, good and found sympathy among liberal minds everywhere. But it went on in the path of the Revolution until it had created a political system entirely different from anything that France had known before. Little was left to remind a Frenchman of the past either in civil or religious institutions. It disregarded all the historical divisions of France, redistricting the entire country. It made all offices elective, even judges and juries in criminal cases, all citizens who paid a certain yearly tax having the right to vote.

The change was altogether too violent. The good things of the past had been swept away along with the bad. The king was a mere figurehead and could not appoint the humblest officer in the smallest local division of the new state. Being completely cut off from the people, he had no means of knowing their wants. It was a weak, ill-joined form of government. Each little locality was in effect a petty independent state, loosely connected with the larger divisions and beyond the reach of the central authority. The principle of popular elections was carried even into the army, whose officers were chosen by the troops, the command in chief being vested in the Assembly.

Organization of the Church. — Changes of a somewhat similar character were made even in religious affairs. The Church was reorganized by the so-called Constitution of the Clergy. This limited the number of the clergy and set up the entirely new principle that the people were to choose the ecclesiastics. Such a principle was wholly opposed to the spirit of the Church, and no true Roman Catholic could conscientiously admit it. It sought to abolish by law one of the cardinal principles of the Church; viz. the idea that authority came from above, not from the people. The king, as a good Catholic, loathed such a violation of the spirit of his religion, and the clergy, so far as they were true to the old faith, could not accept the change. Very few of the higher clergy signed the constitution, and of

the lower orders about 50,000 refused to sign. Thus a large and powerful class in the state were turned into enemies of the national constitution. They became a dangerous element, opposing, with good reason, the tyranny of the Assembly.

Mirabeau.—In the early history of the Revolution there was one statesman whose ability far exceeded that of his fellows and whose genius at first controlled the movement. This was Mirabeau. He favored a limited monarchy and had no sympathy with the extremists. Unfortunately for France, Mirabeau died in the spring of 1791, and the one man who possibly could have restrained the madness of his countrymen was removed.

CHAPTER LXIII

FRANCE UNDER THE LEGISLATIVE ASSEMBLY

The Legislative Assembly. — The Legislature under the new constitution was called the Legislative Assembly, which came together on October 1, 1791, and remained in session for nearly one year, that is, to September 21, 1792. It was composed of far more radical members than the National Assembly; for the latter body had passed a self-denying ordinance, excluding all its members from sitting in the new Assembly. Thus, the latter body was made up of men without political experience. They were, moreover, as a rule young and without much property. The restraint which experience and age impose, and the conservative influences which come from the possession of property, were thus withdrawn.

Parties. — There were three parties in the Assembly: first, the Constitutionals, who favored the constitutional monarchy; second, the Girondists, or moderate Republicans; third, the Mountain, so called from their higher seats in the house, comprising Jacobins and Cordeliers, and sometimes called Red Republicans. The last were the most extreme of all, favoring the leveling of all ranks of society and the introduction of a pure democracy.

The government of France was really in the hands of this Assembly, for the power of the king amounted to nothing. But there was a powerful body whose influence on the law-makers was constantly increasing. This was the government of the city of Paris, the Commune, many of whose members were also members of the Assembly. Its influence was always on the side of the most extreme measures, and some of the worst features of the Revolution were due to it.

The attitude of the Assembly toward the king was not only one of independence, but even of superiority. Its members showed him no reverence, and some were for stripping the throne of its outward dignities.

Austria and Prussia. — It is probable that other European powers would have interfered in France long before this if it had not been that their attention was taken up with the affairs of Poland and the designs of Russia in the East. The three eastern states of Europe, Austria, Prussia, and Russia, had their eyes on Poland with a view to getting their proper share of that country when the time for dividing it up among them had arrived. Russia, too, was apparently plotting to seize a part of Turkey, and this offered another absorbing subject for the consideration of European courts.

Nevertheless, in 1791 the King of Prussia and the Emperor issued the so-called Declaration of Pilnitz, summoning the other powers of Europe to join them in rescuing the French king from the foes of monarchy in France. The effect of this was to bring the Girondist party, who favored war, into power, and the following spring France declared war against the Emperor. The command of the French forces was given to Dumouriez, a general of exceptional talent, but the troops were ill-disciplined, while those of the allies were better trained and more numerous. The army of the allies under the Duke of Brunswick crossed the French border and advanced toward Paris. The duke, feeling that resistance was impossible, issued a manifesto (July 26, 1792), commanding the French people to obey their king, and threatening Paris with destruction if its citizens harmed the royal family.

Massacre of the Swiss Guards. — This insulting manifesto of the Duke of Brunswick threw the people into a frenzy of rage. In their first unreasoning excitement they determined to make the king their victim. A crowd of men from Marseilles entered Paris and demanded that the tyrant should be struck down. On August 10 a mob surrounded the Palace of the Tuileries, which was defended by a force of about 1000 Swiss Guards. The king and royal family took refuge in the hall of the Assembly, but the Swiss Guards stood their ground. Their resistance was brave but utterly hopeless, and they were surrounded by the mob and butchered without mercy. Be-

sides the fine example of heroism and loyalty afforded by the victims, the massacre is significant as showing that the Revolution was passing more and more into the hands of the Commune.

September Massacres. — The brutality of this day was far surpassed by the September massacres; for the murder of the Swiss Guards was committed under the blind excitement of the moment, while the massacres that followed were deliberately planned in advance. The news of several reverses in the war added to the fury of the people. Longwy was taken by the Prussians and the city of Verdun surrendered to them. At the same time there was a revolt of the peasants in the province of La Vendée, where loyalty to the king and nobles was still strong. The people of Paris suspected treachery on every side, and the mere fact that a man had been at one time loyal to the throne was enough to cost him his liberty and endanger his life. Hundreds were thrown into prison and there detained on mere suspicion, and bands of ruffians were hired to search the houses of Paris for suspected persons.

The prisons were full. They were soon to be emptied by a very simple method. The revolutionary government of the city, that is, the Commune, hired bands of ruffians to purge the prisons. One after another the jails were visited and the inmates butchered, their bodies being thrown out to the blood-thirsty crowd.

Such were the famous September massacres, or, as they are sometimes called, the 'Jail Delivery.' It is said that the number of victims was about a thousand. Everything shows that the deed was carefully planned. The leaders of the Commune were responsible, but the savage mob cheered on the work.

Battle of Valmy. — As time went on, the French army gained in discipline and strength; for whatever the faults of the revolutionists, they managed to choose the right men to command their armies, and to inspire in both officers and troops the greatest possible enthusiasm and loyalty to the new France. The allies, on the other hand, were not well officered, and they

were, besides, divided in their plans. They lost some time in debating whether they should push directly on toward Paris, and when they decided at last to do this, the skillful leader of the French, Dumouriez, had gathered his troops together on the Belgian border and placed a strong force on the hill of Valmy. The Duke of Brunswick attacked this, but the French fought well, their position was favorable, and after a short time the allies retreated. It was not in itself a great victory, but it had the effects of one. The Prussian troops were withdrawn on account of Russian intrigues over Poland, and the French were now free to invade the Austrian Netherlands. They won a great battle near Jemapes, and the Austrian Netherlands were gained for France. Almost at the same time Nice and Savoy were overrun by the French. These victories greatly strengthened the cause of the Revolution, inspiring confidence at home and fear abroad. The Legislative Assembly came to an end immediately after the battle of Valmy, September 21, 1792.

CHAPTER LXIV

FRANCE UNDER THE NATIONAL CONVENTION (1792-1795)

Formation of the Republic. — There were no monarchists in the National Convention. All were republicans ; but these were divided into the Girondists, who favored a moderate

policy, and the Jacobins, who represented the most extreme element of the revolutionists.

The first work of the Convention was to abolish the kingdom and proclaim the Republic. After this the Convention was the sole executive and legislative head of the nation. September 22, 1792, the day following the establishment of the Republic, was reckoned as the first day of a new era, being the first day of the Year One in the Republican Calendar, which was in force from 1793 to 1805.

The Girondists were the most numerous party in the Convention, but the 'Mountain,' chiefly Jacobins, was the strongest; for behind the Jacobins was the Commune, and behind the Commune was the mob of Paris. The leaders of the Mountain or Jacobin party were Danton, Marat, and Robespierre, but of these Robespierre soon became the chief, for he represented more fully and consistently the spirit of the radical element.

Louis' Trial and Execution. — Having deposed Louis, the Convention brought him to trial for his offenses. He was charged with conspiring with foreign enemies against France, with responsibility for the massacre of the Swiss Guards, and with seeking to overthrow the liberties of the people. These charges were said to be established by documents found in his possession, including his correspondence with so-called traitors. In the condition of the public mind it was a dangerous thing to undertake his defense; but three men were found who were brave enough to do so. Although the more moderate Girondists were in the majority, they were overawed by the Parisian mob, and the Jacobins carried things in their own way.

At last the day was set for the voting. Three questions were to be settled in order. First, is Louis Capet guilty of conspiring against liberty? Second, should the sentence in the Convention be final, or should there be an appeal? Third, if the king is guilty, what punishment should be inflicted? There was a large majority in favor of the verdict of guilty, and there were two to one against any appeal to the people, because an appeal at that time meant civil war, but the vote

on the question of punishment was for a long time doubtful. Some said banishment, others imprisonment till peace was restored, but those who wished his death were persistent and they terrified the others. Many of the Girondists were frightened into voting for the king's death, and this was decreed by a very small majority. Another vote declared that there should be no delay, and on January 21, 1793, the king was sent to the guillotine. He showed at the last moment a calmness and courage which did much to redeem his character in the eyes of the world.

The First Coalition against France. — The death of Louis was the signal for the union of the chief powers in Europe against France. In the early years of the Revolution England was by no means disposed to take up arms on behalf of the French king, for the liberal party there was strongly in sympathy with the movement. But as France advanced stage by stage toward anarchy and violence, English opinion changed, and when the French went to the length of murdering their lawful sovereign, England was ready to take up arms against the Republic. During the next twenty years she was the strongest and most persistent foe of France.

At the beginning of the war the Girondists were in control. Dumouriez belonged to their party, but he lost a battle at Neerwinden (March 18, 1793), and was driven out of Belgium, which quickly passed back again under Austrian control. Disgusted with the violence of the Revolution and with the growing strength of the Jacobins, he entered into a secret arrangement with the enemy, and tried to carry his army over to the side of the allies. The greater part of the army remained true to the Republic, but with a small force he deserted.

Fall of the Girondists. — The treason of Dumouriez, since he was a Girondist, brought discredit upon that party. Its members were, moreover, disliked by the mob, while the Jacobins were constantly gaining strength; for Paris was in no mood to submit to a moderate policy, and the Girondists were hated because of their opposition to some of the most

unwise and extreme measures proposed in the Convention. They were irresolute and inconsistent, and their course, both before and after the king's execution, was marked by timidity. The cry of "Down with the Girondists!" was heard on all sides, and although they were in the majority in the Convention, they soon became powerless, for the Convention was terrorized by the mob.

In March, 1793, there was created the so-called Revolutionary Tribunal, an unregulated judicial process for the trial of all political offenses, and in the following month a still more important instrument of government was formed in the Committee of Public Safety, to which were given over all the executive powers of the Convention. These two bodies soon gained the entire control of the government, and exercised the infamous tyranny which is characteristic of the worst stage of the Revolution. The Jacobins controlled the Committee of Public Safety, which was supported in all its worst measures by the Commune of Paris. The law providing that the persons of members of the Convention should be inviolable was repealed, and the Girondists were now in the power of the Jacobins. A great outbreak of the mob in the streets of Paris sealed the doom of the Girondists. Their leaders were seized and the entire party fell from power.

Military Successes. — As soon as the control of the government passed into the hands of the Jacobins, there was a marked change in the character of the war. Carnot, the able war minister, showed himself a splendid organizer, and the armies were admirably officered and filled with enthusiasm. The allies, on the other hand, owing to mutual jealousies, were much weaker than they appeared to be. In the campaign that followed they proved their inefficiency. The French General Jourdan defeated the Austrians, and through the strategy of General Hoche, the allies were expelled from Alsace.

The revolutionary government was equally successful in putting down internal strife. The city of Lyons, which was opposed to Jacobin control, was reduced, and the peasantry of

La Vendée, in spite of their bravery and early successes, were defeated by Kleber. The city of Toulon, which had revolted and was relying on aid from the English and Spanish fleets, was captured by the troops of the Republic, their successes being chiefly due, it is said, to the military skill of a young artillery officer named Napoleon Bonaparte. It is certain that Bonaparte was present at the siege, but how far he contributed to the result is a matter of question with historians.

SESSION OF A REVOLUTIONARY COMMITTEE

The Reign of Terror. — Now that the power of the Girondists was broken, and military successes had strengthened the revolutionary party in control, France entered upon that part of the Revolution known as the Reign of Terror. The characteristic feature of the next few months was the wholesale murder of all persons suspected of hostility toward the Jacobin government or lukewarmness on its behalf. To be sure, the victims enjoyed the show of a judicial trial, but sentence was rendered

without regard to justice or the facts of the case and execution followed quickly. The guillotine, named after its inventor, Dr. Guillotin, was a serviceable instrument for disposing quickly of the condemned, and hardly a day passed without seeing a score or more of suspected persons beheaded in the city of Paris alone.

Charlotte Corday.—This series of judicial murders began when the Girondist prisoners were executed. Their death was hastened by the rash act of a young woman who was devoted to their cause and tried to save them. This was the famous Charlotte Corday,

THE GUILLOTINE

who thought that by killing the bloodthirsty Marat, she might deprive the Jacobins of their leader and encourage the friends of the Girondists to rise in their defense. Obtaining an interview with Marat under false pretenses, she stabbed him to the heart. Marat is represented as a monster of cruelty, repulsive in appearance and filthy in dress, and as having a thirst for human blood that amounted to actual madness. But getting rid of him did no good to the cause that Charlotte Corday had at heart, for there were too many in sympathy with the violent policy of the Jacobins. Marat was represented as a martyr, and Charlotte Corday was sent to the guillotine. Her defense of the deed was that she saw civil war approaching and thought to avert it by killing the man whom she considered to be the cause of all the calamities from which her country suffered.

The murder of Marat hastened the execution of the Girondists. Their leaders, including some of the most eminent men in France, were hurried to the guillotine. An early victim of the guillotine was the ex-queen, Marie Antoinette, who, after

being subjected to every kind of insult, was carried like an ordinary criminal in a common cart to the place of execution (Oct. 16, 1793). Thus the Reign of Terror had fairly begun. It spread throughout France and lasted for several months.

Party Chiefs ; Robespierre. — Now that Marat was dead, the leaders of the Jacobin party were Robespierre, Danton, and Hébert. Robespierre soon became the chief man in France; for he was at the head of the Committee of Public Safety, and this was in control of the government. He was a man of one idea, and this was the establishment of the Republic on a basis of absolute equality. Having this one end in view, he never swerved from his purpose or showed the slightest hesitation. The means by which the object was to be attained was the wholesale execution of all who stood in his way. The very dullness and fanaticism of the man strengthened his hold on the people, for they could not doubt his sincerity of purpose.

Danton. — Danton, on the other hand, was a man of real ability, an eloquent orator, and in some points a very shrewd politician. In the early stages of the Revolution he had shown himself as violent as the rest, but this was because he thought that harsh measures were necessary in a time of peril. As the Revolution advanced, he inclined to a more moderate policy and opposed the more radical and senseless measures. But for this very reason he was distrusted by the mob, who thought him lukewarm in the cause of the Revolution.

Hébert. — The most detestable figure among the leaders of the Jacobins was Hébert. It was he who made foul charges against Marie Antoinette at her trial. He knew no mercy or reverence, and he was as indecent as he was cruel.

Triumph of Robespierre. — These three leaders had each a considerable following. The Hébertists were at one extreme. They represented the worst element in the Commune, and were atheists and Communists. Danton and his followers were the most moderate of the three parties. Danton, it is said, would even have spared the lives of the Girondist prisoners.

Robespierre held a middle place. He distrusted Danton as hostile to the true spirit of the Republic, and on the other hand, being a believer in a Supreme Being, hated the atheism and immorality of the Hébertists. In these circumstances he formed with Danton a union for the overthrow of the party which both detested. Hébert and his followers were seized and hastily sent to the guillotine. The next to fall was Danton. His popularity was gone, but he did not seem to realize this, in spite of the warnings of his friends. Robespierre plotted against him and soon managed to secure his arrest and condemnation. Danton was executed April 5, 1794.

Robespierre in Control. — Now that Robespierre was at the head of the government, the Reign of Terror became worse than ever. There were massacres throughout France, and in Paris every day saw cart loads of victims carried to the guillotine. So common was the scene that people looked on as calmly as at a play. It is estimated that between April 16, 1793, and July 28, 1794, 2625 persons were guillotined in Paris. And what was done in Paris was repeated all over France. Thousands were killed at Nantes, Lyons, and Toulon; and, according to the estimate of Taine, nearly half a million were killed in the eight western departments. Ingenious forms of butchery were devised, such as the fusillades of Toulon, where a crowd of victims was repeatedly fired into by the troops until all were killed. At Nantes drowning was the favorite method of execution, the methods being termed by the government's agent Republican Baptisms and Republican Marriages. The former consisted in crowding a boat full of prisoners and sinking it in the river Loire. In the Republican Marriages, a man and a woman, after being bound together, were thrown into the water and drowned.

Robespierre, true to his belief in a Supreme Being, abolished the worship of Reason, which had been established by the Republic, and caused the Convention to resolve that France believed in a Supreme Being and in the immor-

talities of the soul, a singular and shadowy religious faith, by no means agreeable to the great body of the people.

Execution of Robespierre. — The cause of the end of the Reign of Terror and the execution of Robespierre was twofold. In the first place, the success of the French armies made the wholesale murders seem not only bloodthirsty, but needless; and in the second place, it was feared that Robespierre was aiming at a dictatorship. Plots were made against him, and even his own colleagues began planning his overthrow. His death was brought about by the revolution, or counter revolution, of Thermidor (July, 1794). He was at this time planning to arrest some of his enemies in the Convention, but a member ventured to arise and accuse him. The example once set was followed by others, and soon the tyrant was under arrest. The people rose and rescued him, but in vain. He was retaken and sent to the guillotine July 28, 1794.

End of the Reign of Terror. — This marks the beginning of the reaction against the excesses of the Revolution. The radical

A FRENCH DANDY OF 1791

clubs, such as the Jacobins, were now closed. The prison doors were thrown open, and those who had been confined merely on suspicion were released. The Girondists came back to their seats in the Convention, and the Jacobins were soon a despised and hunted class. France now proceeded, by gradual steps, away from the work of the Revolution until she reached a despotism under the government of Napoleon. The Revolutionary Tribunal and the Committee of Public Safety were swept away; the Commune was kept under control and peace reigned in the capital. The reaction showed

itself in the renewal of social entertainments and the display of wealth, which had largely changed hands. A kind of fever

of frivolity seized the leisure classes, as if they wished to make up for lost time. The so-called patriots, marking the return of luxury and display, complained that France had merely exchanged an aristocracy of birth for an aristocracy of wealth.

The Victories of France. — Everywhere the armies of France were victorious. Holland was conquered and formed into the Batavian Republic, dependent upon France. The western provinces, where the revolt of La Vendée had broken out, were pacified, and the English, who, with the emigrants, had tried to effect a landing on the coast, were defeated. Finally the coalition against France was broken. Spain made peace with her, ceding the island of Santo Domingo.

Repulse of the Mob. — The people of Paris did not let the moderate party triumph without a struggle. The popular discontent was increased by the scarcity of the times, and twice the mob rose against the Convention with the cry of "Bread and the Constitution of 1793!" Nevertheless, the Convention continued its attempts to give France a more stable government. It prepared a new constitution, showing a more conservative spirit, and submitted it to the people.

In France generally it was well received, but in Paris the old revolutionary spirit broke out anew. In October, 1795, the mob, some 40,000 strong, attacked the Convention. Its defense had been intrusted to the young artillery officer, Napoleon Bonaparte, who had distinguished himself at Toulon. This was the last trial of strength between the party of order and the Parisian populace. Napoleon's promptness and vigor won the day. He raked the streets with a steady artillery fire, and the mob withdrew in confusion. Thus the Convention was saved and the party of order was firmly intrenched in power. Now, the danger to France was not so much from the rising of the people as it was from the parties plotting some form of despotism. In the brief interval between July 28, 1794, and October 5, 1795, the country had passed from the

government of most violent Jacobins to a condition in which it was actually in danger from a combination of royalists and men of anti-republican tendencies.

CHAPTER LXV

FRANCE UNDER THE DIRECTORY

(October 27, 1795–November 9, 1799)

The New Constitution. — This gave France a very different form of government from that set up in 1793. The executive power was intrusted to a party of five directors, and there were two branches of the Legislature, first, the lower house, or Council of 500; second, the Council of the Ancients, having a membership of 250 persons, all of whom were required to be at least fifty years of age. Each director acted in turn as President.

The Italian Campaign; Rise of Napoleon. — In the period that followed the establishment of the Directory, France took the aggressive in war and was brilliantly successful. The first

great campaign was that against the Austrian power in Italy. In this war Napoleon won his reputation as the greatest military genius of the time. Driving the Austrians before him along different lines of retreat, he was soon in possession of the plains of Piedmont. He then entered Lombardy and defeated the enemy in the decisive battle of Lodi (May, 1796), where he gave a remarkable proof of his personal courage by charging at the head of his troops in the midst of a terrific artillery fire, across the stone bridge that spanned the Adda at that point. Then in a series of remarkable battles he defeated the old Austrian general, Wurmser, and finally destroyed an entire force of cavalry sent against him. In less than a year he had crushed three armies, each superior to his own, had crossed the Alps, invaded Austria, and dictated the terms of peace.

While all this was going on, the other armies of France who were engaged in Germany failed to accomplish anything. This contrast served to make the fame of Napoleon all the greater. He was now started on the course which was to end in his being the emperor of France and the controller for a time of the destinies of Europe.

Early Life of Napoleon. — Napoleon at this time was only twenty-seven years of age. He was born in the island of Corsica in 1769, of a poor but noble family. He was sent as a lad to the military school of Brienne and became afterwards an ensign in the French army. In his boyhood and youth he gave signs of genius, but showed from the first a lack of scruple and a spirit of self-seeking, which became the marked traits of his mature years. Always plotting for the interest of himself and his family and cherishing an ambition for power, he made use of every chance that presented itself.

His Military Ambition. — At first his ambition took no definite form. He seemed to have but little attachment for military life and made one or two ventures in literature and history. His success in Italy, however, opened his eyes to what he called his destiny. At first he was a Jacobin, or at

least professed to be so, but even before the Italian campaign he was keen enough to see that the Jacobin misrule could not endure. He knew, too, that France was certain to encounter some vigorous attacks from without and that the royalists would do their best to bring the Bourbons back to power. To meet this danger, it was necessary to vest the whole military command in one man. Napoleon saw this, and determined to be that man. In Italy he had no idea of forcing republicanism upon the different states, and he surprised his troops by refusing to change Sardinia into a republic.

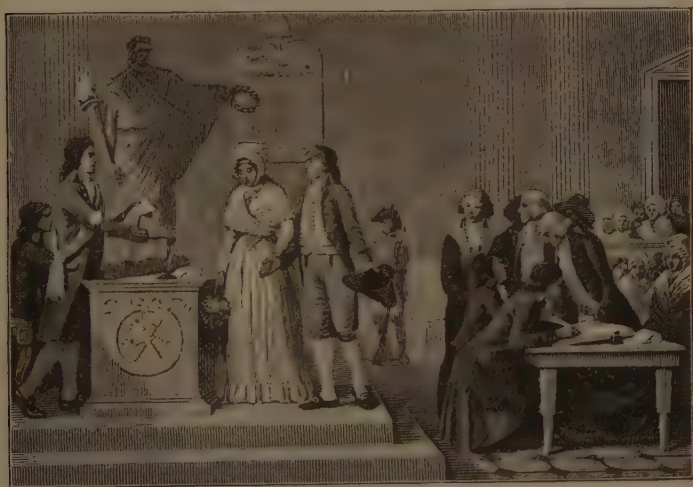

Treaty of Campo Formio. — The Austrians had not come to terms until Napoleon marched his army across the Alps and approached within sight of Vienna. Preliminaries of peace were then agreed to, and later the Treaty of Campo Formio was signed October 17, 1797. By this the Austrian Netherlands (the modern Belgium) were given to the French Republic. Important lands to the west of the Rhine also became French and the northern part of Italy was formed into a republic under the name of Cisalpine Republic. Venice was given up to Austria.

Weakness of the Directory. — The government at home was daily growing weaker on account of the anti-republican and royalist opposition. For a time there was some show of vigor on the part of the Directory, but on the whole there was a desire among the people for a firmer authority at the head of affairs. The great successes of the years 1796 and 1797 had seemed to be in spite of the Directory rather than on account of it, and the people attributed everything to the genius of Napoleon alone. The directors observed this, and when Napoleon returned to France amid the applause of the people, they felt that their security was endangered by his fame and power.

The Campaign in Egypt (1798-1799). — In their uneasiness at the presence of the popular young general, the Directory planned a campaign which would take him out of the country. At first there was a design to attack England, but at Napoleon's suggestion this plan was changed to the campaign into

Egypt. The object of this was not only to conquer Egypt, but to penetrate into the East, and to acquire an empire which should stand between England and her Indian possessions.

In Napoleon's mind there was a vision of Oriental conquests and the possibility of winning for himself an empire like Alexander's. His army was conveyed in safety across the Mediterranean, managing to escape the English fleet. On his way over he captured the island of Malta. Landing in Egypt, he attacked Alexandria and advancing on Cairo fought the 'Battle of the Pyramids,' in which he overthrew the Mame-

A MARRIAGE UNDER THE REPUBLIC

luke, the Egyptian cavalry. This placed Cairo in his hands, but soon afterwards he suffered a reverse in the 'Battle of the Nile' in Aboukir Bay, where Nelson destroyed the French fleet. Nevertheless, Napoleon completed his conquest in Egypt and led an expedition into Syria. After some success he was checked at Acre by the valiant resistance offered by the English commander, Sir Sidney Smith. This ended his attempt at Oriental conquest. While before Acre he had received

news of important happenings at home, and he hastened back to Egypt, whence, after placing General Kleber in command, he returned to France.

The French and the Directory. — In 1798 the French armies had been successful. Three new republics were set up. The Roman or Tiberine Republic, the Swiss or Helvetic Republic, and the Parthenopæan Republic, established on the ruins of the kingdom of Naples. These successes did not serve, however, to prolong the life of the Directory; for though it had the energy to gain territories, it did not have the power to retain them. A few sharp blows drove the French out of Italy, and the newly formed republics soon toppled over. The government in France was unsatisfactory to every class of society. Some feared the renewal of the Reign of Terror, and others the restoration of the old monarchy. The Abbé Sieyès, one of the shrewdest politicians of the time, said, "We must have a chief."

Overthrow of the Directory. — Napoleon returned just at the time when the feeling against the Directory was at its height. A plan was formed to overthrow the government and some of the directors themselves were concerned in the plot, though Napoleon and Sieyès were the chief conspirators. The Legislature was dissolved, and France, being left without a government, was obliged to form a new one. The country as a whole was on the side of Napoleon in this matter, for the Directory was regarded with distrust. This act of violence was therefore no "assassination of liberty," but was the act of men who were shrewd enough to see what the people wanted.

The overthrow of the Directory was accomplished without shedding a drop of blood, and was received with almost universal approval. A new constitution was now adopted, but the government established in accordance with it left the real power in the hands of a single man, and this man was Napoleon, who for many years controlled the policy of the state. Thus the Revolution had in the course of ten years resulted in establishing in France a monarchy no less absolute than that which had been overthrown.

CHAPTER LXVI

FRANCE UNDER NAPOLEON

The Consulate. — The form of government established after the overthrow of the Directory was peculiar. Republican forms were retained, but all the power was in the hands of the First Consul, and the man chosen to fill this office was Napoleon. He had two colleagues, each of whom was called Consul and enjoyed an appearance of authority, but from the first Napoleon as First Consul exercised all the powers of the state. He alone could promulgate the laws, and although there were a Tribune, a Legislative Body, and a Senate, the men chosen as members of these bodies were Napoleon's friends. This constitution was submitted to the people and approved by a large majority.

Soon after the new constitution went into operation, it was clear to everybody that, while nominally the government was republican, it was in reality a mon-

NAPOLEON

archy. The National Guard, so often a dangerous instrument during the Revolution, now became a mere appendage of the regular army. Napoleon, in fact, undid much of the work of the Revolution. For instance, he regained the good will of the Church by an agreement with the Holy See. The Roman Catholic Church was supported and favored by the state. This removed one great cause of discontent. Another change of importance introduced by Napoleon was the creation of a new aristocracy. Men who had gained distinction in any department of life were enrolled in the so-called Legion of Honor, which exists to this day. Besides this, Napoleon created a new nobility, restoring many ancient titles; and, although this nobility was rather a poor affair, it had the effect of attaching the upper classes to him.

Campaign of Marengo. — In the year 1800 England and Austria still remained in the field against France, but the chief opponent now, as formerly, was Austria. Napoleon, therefore, attacked her first. One army was threatening Alsace from the west of Bavaria. The other was trying to get back the lost provinces of Italy. Napoleon, accordingly, got together an army superior to the Bavarian division and placed it under Moreau, while he secretly gathered another force to attack Italy. The Austrians did not suspect that his second force was being gathered, and had advanced to Genoa and Nice, when suddenly Napoleon appeared to the east of them and cut off their retreat.

Moreau, in the meanwhile, had been successful in Bavaria and sent reinforcements to Napoleon. Napoleon had been so successful in keeping his movements secret that the Austrian general, Melas, did not learn of Napoleon's passage across the Alps until May 21, hardly more than three weeks before the battle of Marengo; and within a few days of that battle the French troops captured dispatches to the Austrian general, stating that the report that Napoleon had been gathering a force for this purpose was a mere myth.

When it was evident that Napoleon was in Italy at the head of an army, the Austrian general turned and attacked

him at Marengo, June 14, 1800. It was a doubtful battle at first. In fact, it seemed as if the Austrians were sure of success, for they destroyed the greater part of the French cavalry and captured most of their cannon. Nevertheless, the arrival of reinforcements at the right moment gave the French fresh courage; and the genius of Napoleon in a few hours turned the defeat into a victory which gave him at once the greater part of northern Italy. He had cut off in advance the Austrians' retreat, and thus this one battle obliged his enemy to come to terms. In December of the same year (1800), Moreau won the great battle of Hohenlinden. So in a single year Napoleon retrieved all the disasters which had disgraced the rule of the Directory.

Treaty of Lunéville. — Belgium was again ceded to France, and the Rhine was acknowledged as her eastern boundary. As a result of this war, France really became the dominant power over half the continent, and England was the only great state that still held out against her. But England had been as successful on sea as France had been on land. She had swept the French fleets from the ocean, taken many French colonies, and forced the army in Egypt to capitulate, thus destroying French power there forever. These successes had been gained for England under the administration of her great statesman, Pitt, but his party was now overthrown, and the party opposed to the war gained control of the government. In 1802 England signed a peace with France at Amiens, restoring to the French some of the British conquests.

Internal Affairs. — In the brief interval of peace that now followed, Napoleon had a chance to give his attention to internal affairs, and his activity in works of peace was fully equal to his energy as a military leader. He built bridges, roads, and canals, and greatly improved the means of transportation in the interior. He beautified Paris and other cities of France with fine buildings. He encouraged literature, art, and science, founded schools and colleges, and endowed libraries and museums.

More important than these improvements was his codification of the law. The Code Napoléon embodied the best results of the Revolution. It did away with the inequality of citizens before the law, and abolished the old and unjust regulations that had been an inheritance from the feudal system. The best proof of the excellence of this code is the fact that it has been imitated in some of the most advanced countries of Europe.

Napoleon made Consul for Life and Emperor. — In 1802 the French people declared Napoleon consul for life, with the right to name his successor. But since he had in reality the power of a king or emperor, there appeared no valid reason why he should not have the title. Moreover, the people were disposed to increase his power by the fact that several plots were made against his life. In 1801 an infernal machine was exploded near his carriage, and he barely escaped death, and after he became consul for life another plot was formed against him by the royalists. Napoleon's anger at these plots betrayed him into a serious blunder. This was the arrest of the young Duke d'Enghien in Baden, who was in reality innocent of taking any part in the plot against the emperor's life. He was hurried into France, and after a summary court-martial was executed. It was an act of gross injustice, and, as one of Napoleon's ministers said, "It was worse than a crime: it was a blunder."

In 1804 Napoleon was declared emperor, and was crowned on December 2 in the cathedral of Notre Dame, the pope taking part in the ceremonies.

Renewal of War. — By the terms of the Peace of Amiens England agreed to give up Malta to France, but with the understanding that the latter country should make no more continental conquests. Nevertheless, Napoleon continued to interfere in the affairs of other states. Genoa was incorporated with France, and Napoleon became the arbiter of European affairs from the Baltic to the Mediterranean. The aggressions of France were there regarded as a violation of the treaty, and

England refused to give up Malta. France accused her of violating her promise, and war was renewed in May, 1803, England having won to her side Austria, Sweden, and Russia.

Battle of Trafalgar (1805).—During the early part of the Napoleonic wars, England's successes were gained by her superior navy under the command of the most brilliant naval officer of the time, Lord Nelson. Nelson's last victory was won near Cape Trafalgar', off the coast of Spain, where he met the combined fleets of France and Spain. It was on the eve of this engagement that he sent to the vessels of the fleet the famous message, "England expects every man to do his duty." Most of the enemies' ships were captured or sunk, and the victory gave England the control of the sea, but cost the life of her brave commander, who fell at the moment of victory.

Battles of Ulm and Austerlitz.—Napoleon raised a large force for the purpose of invading England, but found no means of crossing the channel, on account of the failure of his fleet to return at the proper time. He suddenly marched eastward across the Rhine, and threatening the Austrians in the rear, forced them to surrender at Ulm (October 17, 1805). Thirty thousand men became his prisoners without his striking a blow. After this success he lost no time, but marched to Vienna, which he occupied in less than a month after the surrender at Ulm. Now passing on to the field of Austerlitz, he encountered the combined armies of Austria and Russia (December 2, 1805). Here his victory was complete, and it is a good illustration of his military genius that

TRAFALGAR MONUMENT
(London)

he was so sure of the success of his plans that on the eve of the battle he issued a proclamation in which he foretold almost exactly the means by which the victory was won.

Europe after Austerlitz. — This battle made Napoleon master of Europe. Austria gave up Venetia, which became a part of a new Italian kingdom, with Napoleon at the head. The kingdom of Naples was taken from the Bourbons, and Napoleon's brother Joseph was placed on its throne. Sixteen states of Germany, including Bavaria, Württemberg, and Baden, formed themselves into a so-called Confederation of the Rhine, acknowledging Napoleon as their protector. The Emperor Francis II. gave up the crown of the Holy Roman Empire (Germany), which was thus formally dissolved, and he was thenceforth merely emperor of Austria under the title of Francis I.

Humiliation of Prussia. — Prussia had played a very small part in the resistance to Napoleon, but the insults and aggressions of the French finally drove the Prussian king, Frederick William III., to take up arms against them. Prussia's military organization was defective, and her generals were incapable. The French carried everything before them. In the two battles of Jena and Auerstadt, which were fought on the same day (October 14, 1806), the armies of Frederick William were routed, and in two weeks Napoleon entered the Prussian capital, Berlin, in triumph. Prussia was thoroughly beaten. In token of his conquest, Napoleon carried trophies back to Paris from the picture galleries and museums of Berlin.

Peace of Tilsit (1807). — The only formidable opponent left on the continent was Russia, and the French army was now led against her. A bloody but indecisive battle was fought at Eylau (February, 1807), but a little later Napoleon completely routed the Russian general in the battle of Friedland (June 14, 1807), after which the czar was willing to make terms. Napoleon and the Czar Alexander met on a raft in the river Niemen in 1807, and formed the famous Peace of Tilsit. Napoleon wished to obtain the friendship of the czar, and the gains to France by the treaty were at the expense of other

powers than Russia. Alexander appears to have been completely fascinated by the French emperor, and he readily consented to Napoleon's terms.

The worst sufferer by the treaty was Prussia. Half of her territory was taken from her and formed into a new state under the name of the Kingdom of Westphalia, where Napoleon's brother Jerome was placed on the throne. This became a part of the Confederation of the Rhine and thus was under the control of Napoleon. Prussia, moreover, was obliged to limit her army to 42,000 men and to close her ports to British trade. The portion of Poland which she had gained was taken from her and formed into the Duchy of Warsaw under the Saxon king. Prussia was thus dismembered, and what remained of her former territory was wholly under the control of the French.

Another brother of Napoleon's, Louis Bonaparte, was recognized as king of Holland, and Alexander further agreed to join France against England in case the latter power refused to accept the terms of peace.

The Continental System. — Napoleon's power was now at its height. All Europe was at his feet and England alone was in a position to defy his supremacy. But there were certain elements of weakness in his empire. He showed too little regard for the spirit of nationality in other states, and while he knocked kings and princes about at will, he did not reckon with the people.

He committed another blunder in his attempt to close the ports of Europe to British commerce. This was the so-called Continental System, a policy begun in 1806. Napoleon's Berlin Decree of November 21, 1806, declared the British Isles to be in a state of blockade. Retaliatory measures were taken by Great Britain in the Orders in Council (1807). The ports of France and her allies were declared to be in a state of blockade. Then followed Napoleon's Milan Decree (Dec. 17, 1807), which proclaimed that all vessels which touched at British ports were liable to capture. His object was to injure England,

but as the European countries were dependent upon England for many necessities of life, it caused great suffering to his allies. Moreover, so long as England remained mistress of the seas, the continental system could not seriously injure her. At all events, it injured her far less than the countries upon whom it was enforced, and the latter soon became dissatisfied with Napoleon's policy. But the most serious blow to the emperor's supremacy in Europe came from Spain, where he thought his power was secure.

Beginning of the Peninsular Wars.—Spain had been forced into an alliance with France in 1803, and had suffered much in consequence. Godoy', the favorite of the queen, was at that time the power behind the throne, and with him Napoleon entered into an agreement for the purpose of subduing Portugal, which, if the plan succeeded, was to be given to Godoy as a principality. Ferdinand, the son of the weak king of Spain, Charles IV., began a plot against Godoy, and Napoleon pretended to be the friend of Ferdinand. At the same time, however, he was receiving letters from the king of Spain declaring that Ferdinand was trying to dethrone him. Napoleon made use of these intrigues by playing off one party against the other, and having, under false pretenses, secured the abdication of both the king and Ferdinand, seized the crown of Spain and gave it to his brother Joseph.

This insult struck the pride of the Spanish people, who rose against the intruder, and called in the aid of England. The French gained possession of the capital, but later, at Baylen, their general Dupont was surrounded by the Spanish forces and forced to surrender his army (July, 1808). Soon afterwards the usurper, Joseph, was driven from Madrid. In the meanwhile the English had landed in Portugal under Wellesley, afterwards the Duke of Wellington, and driven the French from the country. These successes on the part of the Spanish were not lasting, but had an important effect; for the other states of Europe were encouraged to revolt against the tyranny of Napoleon.

Wagram (1809). — Austria, which had suffered so much at the hands of Napoleon, was the first of the continental states to revolt against him. The campaign was closed by the battles of Eckmühl and Wagram. In each Napoleon was completely successful. For the second time the French entered the Austrian capital in triumph, and the conquered state was obliged to make further cessions of territory and to join the continental system.

Other Aggressions of Napoleon. — In 1809 the Papal States were joined to the French Empire on account of the pope's refusal to close his ports against England. Soon afterwards Holland was united with France on account of the opposition of Napoleon's brother, Louis, who was king of that country, to the continental system. Sweden became the ally of France by choosing one of Napoleon's marshals, Bernadotte, as her crown prince. Some historians regard the years following these events, 1810–1811, as marking the summit of Napoleon's power; for his empire included, besides France proper, Holland, Belgium, the western part of Italy as far as Naples, and north-western Germany. The rest of western and central Europe was composed of states which were dependent upon him. Still the decay of the empire had already begun and his power was more apparent than real.

Affairs in Spain. — When Joseph Bonaparte was driven from Spain, Napoleon set to work in person to repair the damage. He entered Spain in November, 1808, and before the end of the year had made his way to the capital. Despite the brave resistance of the English general, Sir John Moore, and his forces, the vastly superior French force was successful, and Napoleon restored his brother to the throne. He then returned to France in order to deal with Austria, and the result of his war with that power has just been narrated.

Siege of Saragossa. — The Spaniards, though defeated, were by no means subdued. The spirit of their revolt is illustrated by the famous defense of the city of Saragossa. This place was besieged by the French, and its inhabitants were reduced to

extremes of want, but still held out. In January, 1809, an attack was made by the besiegers, and, after some days, they broke into the city. Apparently, and according to the usual experience of war, the city was in their hands, but, as a matter of fact, the real fighting was only now begun. Every street and every house became a little fortification. Gallows were set in the center of the town, and every one who hesitated to meet the enemy was hanged. For twenty days the French were forced to storm the city house by house, and not till a fourth part of the dwellings had been taken in this manner did the inhabitants admit the hopelessness of resistance and surrender. It is said that 30,000 people perished before the town capitulated.

French Reverses ; Wellington.—The French successes in Spain were soon counterbalanced by the genius of Wellington. With infinite care he selected and fortified a position in Portugal, called Torres Vedras ; for he foresaw that the French would invade the country. Napoleon made a fatal mistake in leaving Spain to be reduced by his generals, who, in the long run, showed themselves quite unable to cope with the skill of Wellington. The French invaders entered Portugal under the lead of their general, Masse'na. They had not known of the existence of the fortification of Torres Vedras, and their attempt to capture it was a complete failure. They now had to retreat through a country which had been swept bare of all provisions, and, though they managed to escape by the following spring, their loss exceeded 30,000 men.

Loss of Spain.—Then followed a series of victories on the part of the Spaniards and English, and, at the very moment that Napoleon was preparing to march into Russia, Wellington was on the point of gaining another victory over the weakened armies of the French. In midsummer, 1812, King Joseph fled from Madrid. Thus Spain was lost forever to Napoleon.

The Russian Campaign (1812).—The czar grew tired of the continental system and rejected the alliance with France. This combined with other causes to bring about a war between the

emperor and the czar. Napoleon gathered an enormous army for the invasion. Never before had the boundaries of Russia been passed by such a formidable host. Over half a million men were collected for the expedition, but some were massed on the borders, and only about 300,000 advanced into the interior of Russia. All the vassal states of France sent contingents to swell this vast army, and a comparatively small fraction of it consisted of French troops. The Russians still speak of it as the "army of twenty nations."

Burning of Moscow. — The Russians did not venture a battle at first, but finally tried to check the invaders at Borodino. Again Napoleon's military skill won the day, but at the cost of an enormous loss of life. The Russians henceforth avoided an engagement, thinking that the severity of the climate and the scarcity of provisions would do more for them than an open fight. Napoleon advanced toward Moscow, where he expected to find supplies for his army. To his surprise he found the city deserted, and almost immediately on the arrival of the French it was set on fire. He now had to retreat without sufficient supplies across a cold and barren country. The sufferings of his troops were intense. It is said that of the 300,000 men who invaded Russia only 100,000 started on the return journey from Moscow, and only 20,000 reached the frontier.

Effects of the Expedition. — The effect of this disaster was to encourage and consolidate the enemies of Napoleon for one great attack. At first the people of Europe had looked to Napoleon as a deliverer from the despotism of their sovereigns, thinking that he represented the spirit of the Revolution and meant to bring universal freedom to the world. They were now undeceived; for they saw that he aimed, not at bringing to the world universal liberty, but at founding a universal monarchy.

The War of Liberation. — The harsh measures of Napoleon toward Prussia made both king and people ready for revenge as soon as the opportunity offered. The failure of the Russian campaign encouraged them to make a fight for liberty, and a

great wave of patriotism swept over Prussia as well as the other states of northern Germany. Prussia entered into an alliance with Russia, and these powers were soon joined by Sweden and England.

Napoleon on his return to France put forth all his efforts to raise a fresh army, but the country was exhausted, and though he succeeded in raising a numerous force, the army was not to be compared with those splendid veteran troops which he had formerly led to victory. Nevertheless, in his first conflicts with the allies he was successful.

Battle of Leipzig (1813). — In May, 1813, he defeated them in two battles, and it seemed for the moment as if peace might be made on terms favorable to the French, but at this time there came the news that Wellington had defeated a force in Spain at the battle of Vittoria, and the war went on. Napoleon gained another victory at Dresden, but this was his last success. The allies, united in one great army, forced him to fight at Leipzig. They outnumbered him nearly two to one, and after three days' fighting, the 'Battle of the Nations,' as it was called, ended with the overthrow of the French. This battle really decided the fate of Napoleon.

Abdication of Napoleon. — On March 31, 1814, the allies captured Paris, and on April 11 Napoleon formally abdicated. He was banished to the island of Elba on April 30. The Bourbons were recalled upon promising to grant a constitutional government, but the restored monarch, Louis XVIII., showed something of the old Bourbon spirit. He refused to ratify the constitution drafted by the Senate, and drafted one of his own on the principle that constitutions emanated from the king and not from the subjects. But though it was fairly liberal, and proclaimed the equality of all citizens before the law, it was not satisfactory to the people. Still, if it had been faithfully observed, the Bourbons might have retained their power. Louis, however, violated it; the people were indignant, and Napoleon, returning from the island of Elba, found that the tide had turned in his favor.

Return of Napoleon. — As soon as the allies had conquered France in 1814, representatives of all the great powers met at the Congress of Vienna in order to restore the map of Europe as it had been before the Napoleonic wars. But there was no harmony among them, and the conflicting schemes of Russia and Prussia prevented their reaching any decision.

While their bickerings were going on, the news came that Napoleon had returned, and another alliance was formed against him, Napoleon was received with rejoicing in France, and the Bourbon king was driven from the throne. Napoleon promised to rule as a constitutional monarch, but he had lost his hold on the loyalty of the people and was by no means so sure of support as he had been in the past. Nevertheless, he gathered a large force and prepared to advance against the armies of the allies without waiting for their attack. He hoped to strike the armies of the English under Wellington, and the Prussians under Blücher, before they had a chance to unite, and, marching into Belgium, he first encountered Blücher, whom he defeated at Ligny, June 16, 1815. At Quatre Bras on the same day Wellington successfully resisted the attack of Napoleon's general, Ney.

Waterloo. — Napoleon now thought that he could strike a blow at the English before the Prussians had a chance to come to their aid, and he pressed on to the field of Waterloo. On June 18 he attacked the British forces, and at first gained some slight success, but when he tried to dislodge them from the field by repeated charges, he found that it was impossible to penetrate the squares of the British infantry. The delay caused by this brought about his ruin. The Prussians had time to come up to attack his right wing. As a last resort he ordered a charge of the Imperial Guard on the English forces, but again his attack failed, and as his troops were returning the Prussians attacked them on the right flank, and scattered them in all directions. A few days after the battle of Waterloo, Napoleon again abdicated. Finding escape from France impossible, he surrendered to the British, and was carried by

them to the island of St. Helena, where he remained a captive until his death on May 5, 1821.

Results of Napoleon's Career. — This closed the wonderful career of a man who had done more in the course of a brief life to change the course of history than any other European sovereign. His work was a mixture of good and evil. In the first part of his career the good predominated; in the latter part he was swayed by selfish motives and committed many blunders. By grasping at too much he lost what he had. He gave France a good government so far as internal affairs were concerned, and preserved for her many of the best fruits of the Revolution. Further, he taught Europe some valuable lessons. He showed the weakness of the old system of government, and in the countries where French influence was paramount there was an advance in civilization. The speedy collapse of the German state under his blows proved the need of a more centralized government. Up to his time Germany was a mere federation of over 300 loosely joined states. It was his policy to deprive petty princes of their power and consolidate their states in the Confederation of the Rhine under his rule. The example of such a union was not forgotten, and Germany never returned to her former condition.

The Congress of Vienna. — The renewal of the war had a good effect on the powers represented at the Congress of Vienna; for it made them see the necessity of coming to some agreement about European affairs. Eight powers signed the decrees of the Congress; viz. Austria, France, Great Britain, Prussia, Russia, Spain, Portugal, and Sweden. There were two objects which the Congress had in view: first, the restoration of the political map of Europe; second, the establishment of a new system in Germany. The decisions of this Congress ruled Europe over forty years.

Saxony and Poland. — Among the chief difficulties that they had to overcome were the Saxon and Polish questions. The emperor, Alexander I., of Russia demanded that the duchy of Warsaw, which was all that remained of Poland, should be

given to him. Frederick William III. of Prussia demanded that Saxony should be incorporated in his dominions. There was much wrangling on these points, but finally these powers received almost all that they asked. Prussia got back a part of Saxony and some Polish territory (now Posen) and her provinces on the Rhine, and Russia gained the greater part of the duchy of Warsaw, which was formed into the kingdom of Poland with the Russian czar at its head.

Other States. — England had, as a result of the war, added greatly to her colonial possessions. Norway, which had long belonged to Denmark, was united to Sweden. In Italy the king of Sardinia got the republic of Genoa, but, in general, the different states of Italy were given to members of the Austrian house. In the south, however, the kingdom of Naples was bestowed upon the Spanish Bourbon, Ferdinand IV. Thus Italy was left without any unity whatever, except for the fact that most of its rulers belonged to the Austrian house. The number of the Swiss cantons was increased to twenty-two, and the Swiss confederation was recognized. The Austrian Netherlands, now Belgium, were united with the old Dutch Republic and formed into the kingdom of the Netherlands. The king of Denmark was allowed to enter the new German confederation as Duke of Holstein.

German Affairs. — So much for the settlement of general European affairs. The next problem was the founding of a new German union of some sort which should not be so strong as to overthrow the balance of power in Europe. A united Germany was necessary, but a strong Germany was feared. The way the problem was solved is as follows: a confederation was formed of thirty-nine independent states, and this remained, until the year 1866, the central government of Germany. The presiding state in this new confederation was Austria. The character of the confederation was defective in that it did not make the central government strong enough. Still it was an improvement over the previous condition of Germany, since it reduced the number of states from over 300 to only 39.

General Results of the Wars. — To adjust matters after the great upheaval of the Napoleonic wars had been a task of enormous difficulty, and many of the arrangements which the Congress so carefully made were doomed to failure. In German affairs it would seem at first thought that the advantage was given to Austria. As a matter of fact, however, Prussia was, in the long run, destined to derive the most from the new arrangements. The rivalry between these two great states of Germany becomes, from this time on, the main point of interest in German history. In the battles of Leipzig and Waterloo the kings of Europe had triumphed over France. Since France stood for the new ideas, it would naturally seem that this victory meant the overthrow of the principles of the Revolution. Nevertheless, the arrangements made in 1815 really preserved many of the good things which the Revolution had brought about; for Europe had progressed during this interval, and it was impossible even for the reactionary monarchs to put things back exactly as they had been. To Germany the Congress gave a constitution which contained the best results of the Revolution, and to Europe it gave peace.

CHAPTER LXVII

EUROPE IN THE NINETEENTH CENTURY — FROM 1815 TO 1830

The Holy Alliance. — On September 26, 1815, before the allies had left Paris, a new alliance was entered into by the three chief powers of the continent, — Alexander I. of Russia, Francis I. of Austria, and Frederick William III. of Prussia. This agreement is known in history as the Holy Alliance. The promoter of it was the czar, who had fallen under the influence of a religious enthusiast, Frau Von Krüdener. The declared purpose of this alliance was to make the principles of the New Testament the guide in political matters. The sovereigns resolved "henceforth to take the Christian religion as their guide; to rule their states and regulate their conduct

towards their citizens, strictly in accordance with the precepts of justice and Christian love and peace." It was declared that the relation of the king to the subject should be that of father to son.

There is no doubt that the czar Alexander was sincere in bringing about this arrangement. But it became in the course of time merely a league of sovereigns against peoples, and its influence was almost invariably exerted on the side of tyranny. It was well enough to say that the principles of the New Testament should guide the policy of states; but the important question was, who was to decide what the principles of the New Testament were. According to the Holy Alliance, this decision was to be made by the sovereigns alone. The alliance was afterwards joined by every great European power except England, the Sultan of Turkey, and the pope. England declared that by her constitution the voice of her people in Parliament assembled must be her guide, and not the royal interpretation of the New Testament. The sultan was, of course, debarred by his religion, and the pope considered himself better fitted than a secular sovereign for defining the moral duties of a Christian government. There were several great congresses of the European powers held to carry out the principles of the Holy Alliance, and the results of these congresses were of great importance. The first of these was at Aix-la-Chapelle (1818), where it was decided to withdraw from France the army of occupation.

France under Louis XVIII. — Louis XVIII., although he had shown himself unwise on his first restoration, was on the whole favorable to a moderate government. But his brother, Count of Artois, was a Bourbon of the old type, narrow-minded, bigoted, and bound to bring back despotism. There was a numerous party that favored these reactionary ideas, but during Louis' reign the party that favored a constitutional monarchy gained in power. Louis died in 1824 and was succeeded by the Count of Artois under the title of Charles X.

Spain. — Ferdinand VII., who belonged to the Bourbon

family, had been restored to the throne of Spain. He ruled as an absolute monarch. But Spain had established a constitution in 1812, which gave certain definite powers to the representatives of the people. The educated classes generally favored a government in which the king's authority was restricted by that of Parliament, but Ferdinand disregarded this feeling entirely. He tried to restore everything as it had been before the Revolution. He offended the best classes of the Spanish population. Moreover, he became involved in difficulties with his American colonies; for the latter revolted against Spain and formed themselves into independent states. The government spent an enormous amount of money and wasted thousands of lives in the attempt to restore the Spanish power over the colonies. The treasury became impoverished and the troops were ill equipped. Discontent pervaded all classes, especially the army, and in 1820 there was a military revolt whose leaders declared themselves in favor of the constitution of 1812.

The Congress of Verona. — The attention of the members of the Holy Alliance was turned to Spain. Representatives of the powers assembled at Verona in 1822 and decided to interfere in Spanish affairs; for the revolt there seemed to promise the triumph of the principles of the French Revolution. The insurgents had proclaimed the constitution of 1812, extorted concessions from the king, and placed the liberals in control of the government. These things were enough to make the members of the Holy Alliance anxious. It was decided at the Congress of Verona that France should interfere on behalf of Ferdinand VII. in Spain, although England opposed this course and advised France to do the same. In fact, England was the only great European power that adopted a liberal policy. In 1822 Canning became secretary for foreign affairs in England and his influence was always exerted on the side of popular rights. But France disregarded the advice of the English representative at the Congress of Verona, and the Duke of Angoulême, at the head of a large army, entered Spain and crushed the revolutionists. The leaders of the revolt were hanged, a

large number of those who had demanded a constitutional government were thrown into prison, and Ferdinand VII. was restored in all his absolute power. Thus through the influence of the Holy Alliance the liberal movement in Spain was crushed out.

Italy. — We have seen that members of the Austrian house ruled over most of the principalities of Italy as a result of the decision of the Congress of Vienna. Their rule was tyrannical, and there arose a party among the natives that favored a limitation of the royal power. One of the most powerful influences in Italy was exerted by a secret society called the Carbona'ri, which aimed at overthrowing the despotism under which their country suffered. The news of the Spanish revolt caused a sympathetic movement in Italy. In the kingdom of Naples a constitution similar to the Spanish constitution of 1812 was proclaimed. The liberal party seemed on the point of triumph, but now, as later in the case of Spain, the Holy Alliance intervened. A congress of the members of that league was called in Troppau in 1820, but afterwards transferred its meeting to Laibach in 1821. A league between Austria and Russia and Prussia was formed at this Congress, and Austria was commissioned to enter Italy and crush out the revolution. An army of 60,000 men was accordingly dispatched by Austria to Italy, and the revolution was overthrown.

Germany. — After the Congress of Vienna the most potent influence in European politics was exercised by Prince Metternich, the minister of Francis I., Emperor of Austria. This influence was always on the side of the dynasties, and against the people. Metternich looked upon the overthrow of Napoleon as the death of the principles for which the French Revolution stood, and he wanted to bring back the old order of things. He was seconded in his schemes by the emperor Francis I., whose ideas on political subjects are best illustrated by some remarks which he addressed to a delegation of teachers that interviewed him in Austria. "There are now new ideas in progress," he said, "which I can not and will not approve. Hold fast to old ideas. I need no learned men. I do need

brave citizens. Your duty is to make the nation into such. Whoever serves me must accept what I command. Whoever is unable to do that, or comes to me with new ideas, can go or I will remove him."

Suppression of Liberalism. — It was the policy of Austria to suppress any liberal movement the instant it showed itself. Naturally this policy was especially effective in Germany, of which Austria at this time was the leading state. On the 18th of October, 1817, the students of the University of Jena gathered together and, in imitation of Luther, burned some pamphlets attacking German unity. Before this the liberal party in Germany had shown opposition to the existing government because constitutions were not granted in the German states. This outbreak of the students at Jena was looked upon by the Austrian government as a revolution, and in 1819 another event occurred which increased the alarm of the forces of absolutism. This was the murder of a writer named Kotzebue by a Jena student. Kotzebue had written against the liberal programme and was regarded by the liberal party as a foe to the liberals of Germany. A young student named Sand felt that he was serving the cause of the liberals by murdering Kotzebue. Sand was executed for his act, and the reactionary party, headed by Metternich, now called a congress of the German ministers at Carlsbad, August 6, 1819. This congress decided upon several repressive measures, among them a stricter censorship of the press and a rigid superintendence of the universities. The object was to prevent all liberal agitation, and it was soon evident that the hope of the German states for a constitutional government was vain.

The War of Greek Independence. — In the early part of the nineteenth century Greece was a province of Turkey. The tyranny of the sultan, coupled with the weakness of his state, led the Greeks to revolt. There had been in existence for some years a secret society organized for the purpose of inciting the people to make an effort for their liberty. The revolt broke out at first in the provinces to the north of Greece,

where it was hoped that the people would rise against the Turkish government. It was unsuccessful there, but in Greece proper there was much enthusiasm for the movement. A national congress was called, and in 1822 adopted a new constitution.

Throughout Europe much sympathy was felt with the Greek cause. Nevertheless, the members of the Holy Alliance chose to regard it merely as a revolt of the people against their government, and at the Congress of Verona it was decided that no aid should be given to the rebels. So Greece was left at

A GREEK

first to fight against the superior power of the Turks without any outside aid. Many barbarities were committed by both sides during the war. The Turks, having taken the island of Scio, massacred nearly 20,000 of the inhabitants, and the Greeks took a no less bloody revenge whenever they had the good luck to capture a body of the enemy. But volunteer troops came to their aid. Among these chivalrous foreigners was Lord Byron, who died of fever at Missolonghi in 1824 while trying to aid the Greek cause.

Greek Independence Secured.

—In the end the Greeks won their liberty, but not by their own exertions. The states of Europe interfered in their behalf, not so much from considerations of the right and wrong of the matter, as from the fear that Russia would take the side of Greece and pay herself for the trouble by seizing a part of the Turkish territory. For Alexander I., the founder of the Holy Alliance, had died in 1825, and he was succeeded by Nicholas I., who was inclined

to take the side of the Greeks. By the Treaty of London in 1827 the great powers formed another alliance which resulted in the liberation of Greece. A Turkish army had overrun the Greek peninsula and the little nation was on the point of destruction, but the allies overthrew the Turkish fleet in the battle of Navarino, October 20, 1827, and Greek independence was soon afterwards formally established. In the years 1828 and 1829 Russia, who had a special grievance against Turkey on her own account, waged war with the sultan and obliged him to conclude a peace on advantageous terms to her. By this peace, known as the Treaty of Adrianople (1829), the sultan recognized the independence of Greece.

CHAPTER LXVIII

THE REVOLUTION OF 1830 AND ITS EFFECTS

France under Charles X. — Charles X. tried to restore the old system of the Bourbons. He was devotedly attached to the Church and wished to make the ecclesiastical power all that it had been in the past. His policy was unpopular, and a liberal ministry gained control for a while, but was succeeded

by a ministry which represented fully the extreme and narrow-minded views of the king. This was the ministry of Prince Polignac, which was bitterly opposed by some of the most eminent men of France. In the opposition were to be counted the great names of Guizot, Thiers, and Benjamin Constant. The first two were especially active as advocates of a constitutional government. The king's party tried to win popular favor by a campaign in Algiers, which, though it was successful and laid the foundation of the French power over that country, did not have the desired effect. The Legislature was active in its opposition to the king. The government now took the rash step of dissolving the Chamber, and when the time came for its reassembling declared the elections illegal, and so prevented the meeting of the Assembly. These and other decrees equally unpopular were issued in July, 1830, and are known in history as the Ordinances of St. Cloud.

The Revolution of 1830 in France. — Between 1815 and 1830 the friends of constitutional government had been gaining ground, and the Ordinances of St. Cloud were regarded as violations of the constitution. It was planned to resist them by force. Paris was in an uproar, and the citizens managed to arm themselves and took possession of the city hall. The king refused to yield until it was too late. The army, on which the government had relied, was in full sympathy with the people. In a few days the king and his ministry were obliged to flee from Paris and a provisional government was set up. In this crisis all eyes turned to Louis Philippe, the Duke of Orleans, as the right person to assume the crown. He appeared in Paris, and members of the Legislature declared him Lieutenant General of the kingdom. Charles X. agreed to this, for he did not seem to suspect that Louis Philippe had any idea of becoming king. The sincerity of Louis is a matter of doubt. At all events, when he found that the representatives of the people wished him for their king, he did not allow himself to be troubled by a sense of duty to Charles X. Resistance on the part of Charles was hopeless, for he was deserted by the army.

Effect of the Revolution of 1830. — In France the Revolution of 1830, or the July Revolution, as it is sometimes called, was thus completely successful. It now remains to trace the effects of the movement upon other countries. Between 1815 and 1830 the discontent of the liberal element in each of the European states had steadily increased; for the rulers, true to the policy of Metternich, refused to take one step in the direction of popular government. Accordingly when revolution broke out in France, the disaffected classes in the other states were quick to follow the example. Since European sovereigns generally followed the same policy in dealing with their subjects, the liberal party everywhere had much the same grounds of complaint. So it happened that during the first half of the nineteenth century, a revolt in one part of Europe was sure to be followed by sympathetic outbreaks in other parts. This was true of the Revolution of 1830. Belgium was the first to feel the effects, and the revolutionary spirit quickly showed itself in Poland, Italy, Germany, and even England.

Belgium. — To suit the supposed interests of the European courts, Belgium and Holland had been united into a single kingdom by the Congress of Vienna in 1815. It was an unnatural union, formed in utter disregard of the prejudices of the two peoples. William I. of Holland was the head of this united kingdom, and offended the Belgians by his arbitrary treatment of them. When revolution broke out in France,

THE COLUMN OF JULY
(Commemorating the Revolution of 1830)

Belgium rose against the oppressor. A provisional government was established at Brussels and the independence of Belgium was declared. A sharp struggle followed between the Belgians and the government, for William, supported by his Dutch subjects, was bent on maintaining his rule. But for the interference of foreign powers, the Dutch would probably have forced Belgium back into the union. The foreign governments recognized her independence in 1831, and Leopold I. of Saxe-Coburg became king. French troops aided him in the war with Holland, and in 1833 independence was secured, though it was not formally admitted by Holland till 1839. Leopold was a liberal prince, and under his government the country prospered.

Poland. — Here, too, an effort was made to overthrow one of the arrangements of the Congress of Vienna. It will be remembered that the Congress gave the Duchy of Warsaw to the Czar Alexander I. of Russia, who, however, was not to incorporate it with Russia, but to rule it separately. It had a constitution of its own and a separate administrative system. Unfortunately, the government was intrusted to Alexander's brother, the Grand Duke Constantine, who lacked both ability and tact, and needlessly offended his Polish subjects. Alexander died in 1825, and was succeeded by Nicholas, who supported the misgovernment of Constantine. Nicholas was the enemy of all liberal ideas, and when revolution broke out in France and Belgium he wanted to form an alliance against those countries. Preparing for war, he ordered the Polish army to be put on a war footing. This was the signal for a military revolt. In a short time the government was in the hands of the insurgents. Constantine fled, but the Czar would not treat with the rebels or promise any reforms. Instead of this he sent an invading army under General Diebitsch into the country. The Poles showed all their old-time lack of harmony in the presence of danger. Divided among themselves and badly generalled, they were defeated in the battle of Ostrolenka, May 26, 1831. General Diebitsch died soon afterwards, but

the command of the Russian armies was vested in an equally able leader, General Paskevitch, who captured Warsaw in September. The Poles had fought bravely, but they suffered from the inefficiency and even treachery of their officers. One of their generals surrendered an army of 10,000 men without fighting a battle. Their cause was lost, and they were not even allowed the small measure of independence which they had enjoyed before the war. Nicholas destroyed the last vestige of Polish liberty. He absorbed the entire state in his Russian dominions.

Italy. — Italy also felt the shock of revolution. The Carbonari with its programme of liberty and union for Italy had been gathering strength, and when news came of the successful revolution in France several Italian cities became the scene of revolutionary agitation. In 1821, Naples and Sardinia had been the centers of the revolutionary movement. In 1831, it was the States of the Church, where the government of the cardinals was hated by the liberals. But in Modena and Parma, also, there was revolution, and the Austrian rulers of both these states were driven out. At first the revolt was equally successful in the Papal States. Representatives of the states in a general assembly abolished the temporal rule of the pope, and set up a new government. But the time had not come for the triumph of liberal principles in Italy. Only a few of the states took part in the revolution, and the rest gave no effective support. The insurgents had counted on aid from France, but none was sent. Without outside aid or internal union there was no hope of success against the great power of Austria. With the aid of Austrian troops the revolt was easily put down. The rulers of Parma and Modena came back to their thrones, the pope regained his temporal power, and the old order of things was restored. Nevertheless the liberal cause was by no means crushed. The party of Young Italy, under the guidance of the brilliant and zealous Mazzini, kept alive the hatred of Austria and the aspirations for liberty and self-government; and in the north the kingdom of Sardinia,

whose king was an enemy to the Austrian rule, and inclined to a liberal policy, seemed to promise a nucleus for Italian unity and independence.

Germany. — When the Congress of Vienna reorganized the government of Germany in 1815, it promised that constitutions should be granted to the separate states. We have seen, however, that the spirit of Metternich was the controlling influence there, and that anything that looked like liberalism was sternly repressed. The Carlsbad Decrees (1819) mark the triumph of this repressive policy. Nevertheless several of the German states managed to secure constitutions, partly through threats of force, and partly through the good will of their rulers. For the Germans, also, were greatly influenced by the revolution in France, and before the year 1830 came to an end there were uprisings in Brunswick and Saxony. These states, as well as Hesse, Hanover, and several of the south German states, gained important concessions from their governments. But here, as in Italy and Poland, the liberal movement was only temporarily successful.

England and the Reform Bill (1832). — England introduced reforms not by the Continental methods of revolt and bloodshed, but by the pressure of public opinion upon her representatives in Parliament. The Revolution of 1688 had completely changed her system of government, and gained many of the results aimed at by the French Revolution just one hundred years later. And yet the Revolution of 1688 had taken place without bloodshed. Fully as great a change in her system of government was accomplished by the passage of the Reform Bill of 1832, and this change was also brought about by peaceful means, although there was for a time a threat of violence. The Reform Bill gave the right to vote to hundreds of thousands of people who had not before possessed it. It brought the middle classes into power, and so swept away the exclusive right of the aristocracy. Before 1832 the members of the House of Commons were chosen by a very limited class of voters, seats were often in the gift of members of the nobility,

and little places with a handful of inhabitants had the right to return a member, while some of the largest and wealthiest cities were without representation. The Reform Bill redistricted the country and extended the suffrage. It did not grant this right to the great mass of the people, but it was a step in that direction. The gainers by it at first were merely the middle class,—a class which had become wealthy and powerful and could no longer be disregarded. The Tories bitterly opposed it as a revolutionary measure, and such in fact it was. In the meanwhile more liberal views in religious matters had begun to show themselves. The Catholic Emancipation Bill removing the disabilities against Catholics was passed in 1829. Down to this time they had been excluded from almost all important offices and could not sit in Parliament.

Summary.—The revolutionary movements of 1830 and 1831 arose from the discontent of the people in the several states with the policy which controlled European affairs after the Congress of Vienna. The first representative of this policy was the Holy Alliance, which to liberal minds appeared to be a league of the despots against the people. The Holy Alliance, whose guiding spirit was Prince Metternich, held that the interests of the sovereigns were the same, that a revolt against the government of one was a menace to the power of the others, and that armed intervention on behalf of any ruler who happened to get into trouble with his subjects was the duty of the other members of the league. The spirit of this policy was shown in Germany by the Carlsbad Decrees (1819), which checked the liberal movement there. It was shown also at the Congresses of Troppau and Laibach, where it was decided to crush the popular movement in Italy, and at the Congress of Verona (1822), where it was decided to take the side of the Spanish despot against his subjects. On each of these occasions the policy of intermeddling was carried out with success; and the idea that a nation's domestic affairs were the concern of all other powers became so fixed in the minds of the sover-

eigns that they even thought of reaching across the Atlantic and forcing Spain's revolted colonies in South America back into submission. Here, however, England, through her minister Canning, made an emphatic protest, and the government of the United States set up in the famous Monroe Doctrine the principle that the monarchies of the Old World had no business in the New. The allies drew back, and Spain lost her colonies forever.

The Revolution of 1830 was successful in France, the country of its origin. A popular king came to the throne and took his oath to a constitution limiting the royal power in important respects. It was successful in Belgium, who detached herself by force from a union which she detested, and who placed on the throne a king of liberal views. Under the new system she prospered, and later, when political storms arose in other countries, they passed her by. The revolution failed in Italy, and the old system was restored. It was worse than a failure in Poland, for the Duchy of Warsaw, all that was left of the Polish state, was blotted out of existence, becoming a part of Russia. In Germany it was successful at first, but in a few years the liberals lost much of what they had gained. England was out of the current of European affairs, yet there, too, occurred a struggle between the old and the new. A great and peaceful revolution was effected, giving a share in the government to a class that had never before possessed it. So the results of the Revolution were somewhat doubtful, but viewing them broadly we can see that the new ideas had gained ground. And, as we shall see in the next chapter, it was not long before another great wave of revolution rolled over Europe.

CHAPTER LXIX

EUROPE FROM 1831 TO 1851

France under Louis Philippe. — The new king was popular at first. His government was moderate and in some respects even liberal, as compared with the government of his predecessor. For instance, he extended the suffrage by lessening the amount of property required to entitle a man to vote. But the difficulty of governing France at this time was very great, for there was a constantly growing demand for an enlargement of popular rights. There were three parties in the state: first, the conservative party, that had brought Louis Philippe into power and wished to keep things as they were; second, the moderate constitutionalists, who would be content with the monarchy if it adopted measures of reform, such for instance as a further extension of the suffrage; and, third, the radicals, who wanted a republic. The great representative of the first party, which was of course the party of the king, was Guizot; and of the second, Thiers; these two being the leading statesmen of the time, while the radicals included among them men of all shades of opinion from moderate republicans to socialists. Louis Philippe tried to follow a progressive policy until he became alarmed at the threatening attitude of the radicals.

Several attempts were made on his life, and, after one of these, when a conspirator named Fieschi threw an "infernal machine" in the street as the king was passing, laws were passed restricting the liberty of the press. The king thought that if he respected the constitution at home and maintained peace abroad, he would win the good will of his subjects. In both these respects he was wrong, for his people wanted a change in the constitution and a foreign war. They wanted France to intervene on behalf of Poland and Belgium, and they wanted every adult male citizen to have the right to vote. In the matter of intervention the king yielded to some extent, for, as we have seen, French troops aided the Belgians in the war with Holland. Yet the foreign policy of France was in general unsatisfactory, especially in regard to Eastern affairs. At this time the Sultan of Turkey was having trouble with his vassal, Mehemet Ali, the viceroy of Egypt, who was trying to enlarge his dominions and make himself independent. In one war with the Sultan, Mehemet secured the government of Syria; in another he sent a conquering army into Asia Minor and threatened Constantinople; and in a third, renewed by the Sultan for the purpose of making good his losses, Mehemet brought the Turkish Empire to the verge of ruin. The four great powers, England, Prussia, Austria, and Russia, having joined in the Quadruple Alliance, interfered and saved Turkey from destruction, restricting the power of Mehemet Ali. France had been his friend, and the action of the allies proved the French policy a failure. The people favored war rather than submit to this, but the government thought otherwise. Its course seemed to the people cowardly and disgraceful. The king increased his unpopularity by his avarice and by his schemes for adding to the power of his family. But the most important thing of all was the attitude of the throne toward the demand for universal suffrage.

Efforts for Reform. — Hardly one twenty-fifth of the adult male population of France had the right to vote, even after the government had extended the suffrage; but the king refused

to go any further in the path of reform. In this he was guided by the advice of his minister Guizot, who, while he believed in a moderately progressive policy, distrusted the people, and thought that the extension of the suffrage would be a step toward the anarchy of the Reign of Terror. Since the number of republicans throughout the country was increasing, it seemed to the government that adding to the number of voters was putting power into the hands of its enemies. In 1845, Lamartine founded a journal and began in it an agitation for universal suffrage. The editors of about thirty daily papers followed his example, and one of these editors, named Ledru-Rollin, was elected to the Assembly in 1846. Thiers, though opposed to the views of the extremists, also demanded an extension of the suffrage. The reformers tried to control the Assembly, but, failing in this, they determined to appeal to the people. Reform mass meetings were held, at which violent speeches against the government were made; but the king, relying on his majority in the Assembly, paid no attention to the agitation.

Revolution of 1848.—The conflict came when Guizot prohibited the holding of a great reform banquet appointed for February 22, 1848. Mobs gathered in the streets shouting for reform and "Down with Guizot!" For four days the rioting continued, and though the king finally consented to the reforms and appointed Thiers to the ministry, the concessions came too late. The republicans wished the overthrow of the government. Louis Philippe abdicated in favor of his grandson, the Count of Paris, but the people rejected him and demanded a provisional government as a step to the establishment of a republic. For a time it seemed as if Paris was about to pass through the violent scenes that had disgraced the Revolution of 1789. Among the revolutionists were many who wanted the most radical changes. Socialists like Louis Blanc wished to set up a government which should recognize its obligation to provide for the employment and support of all citizens. The middle class, however, fearing the anarchy of mob rule, stood by the moderate republicans. A provisional

government composed of Lamartine, Ledru-Rollin, and others, was formed, and declared for a republic based on universal suffrage. The matter was to be voted upon by all the people of France in April. This reference of the question to the popular decision was just what the radicals did not want, for they knew that while they were strong in Paris, moderate views were likely to prevail throughout the rest of France. Accordingly, on April 16, a great mass of the Parisians moved against the City Hall for the purpose of enforcing their will by violence; but the National Guards took the side of the party of order, and the mob was dispersed.

The Republic Established. — The elections now went on and members were chosen for a National Assembly. The majority was composed wholly of moderates, and the radicals were insignificant in point of numbers. The people of France through their representatives had decided for a republic and against the wild schemes of the extremists. This National Assembly, however, was weakened by divisions among its members, and the radicals, taking heart, attempted another revolution. A mob attacked the Assembly on May 15, drove out some of the members, and declared the body dissolved, but the National Guards dispersed the mob. Before this the Assembly, in an effort to please the socialists, had set up National Workshops on the principle that the government was to provide work for the unemployed. The scheme was a ridiculous failure, but when the government tried to give it up and dismissed part of the workmen, the socialists and communists again fell to rioting. From June 23 to June 26 occurred a famous four days' fight in the streets of Paris, and it was not till the Assembly had called in the aid of General Cavaignac and made him dictator that the revolt was put down. Protected by Cavaignac and the army, the Assembly went on and drew up the constitution of the republic.

Louis Napoleon. — The head of the new republic was a president elected by universal suffrage. The question was who should be selected for this office. In France at this time there

was no one among her active politicians whom it was safe to choose, for all the leaders were partisans. Cavaignac, though a brave general, lacked the qualities of a successful statesman. In these straits it was necessary to fall back on the bearers of great names, and of these the least objectionable was Louis Napoleon Bonaparte. Kings had been too often driven from the throne to make it possible to choose a Bourbon, while the name of Bonaparte was associated with the glory of France. Louis Napoleon, up to this time, had been rather insignificant. Years before, he had made two ill-judged attempts to stir up the people against the government, and had failed completely. People thought him dull. But this did not matter. He was modest and unassuming and thought to be a safe man for the place. The people of France elected him by an enormous majority. This was the outcome of the Revolution of 1848, the so-called February Revolution in France. The next thing to consider is how the movement affected other countries.

Germany. — Again revolution in France was the signal for outbreaks in the other European states. In Germany several of the small states felt its effect at once. The news barely had time to reach Germany when the agitation was begun. In Baden the popular party demanded freedom of the press, trial by jury, popular representation, and other reforms. The government yielded, and the example of Baden was quickly imitated in the other states. Within a very few days important reforms were granted in all the smaller states. Prussia and Austria also felt the shock, but did not yield so readily. In Germany the patriotic party aimed not only at an enlargement of popular rights, but at the unification of the German states and the establishment of a better form of central government in place of the old Confederation, which, it will be remembered, was the creation of the Congress of Vienna.

In March, 1848, there were popular demonstrations in the streets of Berlin, for the Prussian king, Frederick William IV., would not yield at first to the demand for representative

government. The king gave way at last, but would not listen to the demand of the people that the troops should be sent away from Berlin. Conflicts between the people and the troops broke out, and over two hundred of the former were shot down; but this angered the people all the more, and the revolt became so threatening that the king sent away the troops. The king now declared himself at the head of the popular movement for liberty and German unity. In a proclamation addressed to his people and the German nation, he used the famous words, "Henceforward Prussia takes the lead in Germany."

The success of the movement in Prussia had been aided by the news from the Austrian capital. On March 13 and 14, 1848, there was an uprising in Vienna; Metternich was forced to lay down his office and flee to England; the imperial court was removed to Innsbruck, and the control of Vienna passed to the revolutionists. What was even more alarming, the same spirit showed itself all over the Austrian empire, which seemed for the moment on the point of dissolution. All these movements had resulted in the victory of the liberal party in its struggle against the German governments. The next point to be decided was the question of German unity.

The Meeting of the Frankfort Parliament (1848).—On May 18, 1848, there met at Frankfort an assembly of statesmen and scholars, chosen by the direct vote of the people, for the purpose of giving Germany a new government which should insure security without and liberty within. It was the first time in the history of Germany that such an event had taken place. It seemed to promise the birth of a new German state—a state, moreover, created by the people. The people were enthusiastic, and high hopes were entertained of its work. Unfortunately the difficulties in the way of reorganization were very great. In the first place, there was the rivalry between Austria and Prussia and the question which of them should take the lead in the new state. In the second place,

there was the opposition of the princes of the smaller states to any further steps toward liberal government. Moreover, the energy and practical common sense necessary to overcome these difficulties were wholly lacking in the Assembly. Having everything to do, they did nothing but talk. They wasted their time in fruitless discussion, at a time when prompt action meant everything; for reform was possible only when the revolutionary spirit was at its height, and before the reaction set in.

Italy. — Italy broke out in revolt against the Austrian power a few weeks after the beginning of the revolution in France. The Austrian troops were driven out of Lombardy. An Austrian force surrendered to the Venetians, and Venice became a free republic. In Parma and Modena the Austrian governments were again overthrown. The pope's ministers were murdered, and he himself obliged to flee. The Duke of Tuscany ran away rather than submit to the demands of his subjects. Thus in a short time the Austrian power in Italy was overthrown. At the head of the movement was Charles Albert, King of Sardinia, a member of the royal house that was destined to win unity and independence for Italy. For the moment the revolution was successful.

Reaction ; France. — After 1848, as after 1830, there was a reaction against the revolution. In the first moments of enthusiasm the people went too far, and some of their work was afterwards undone. Governments frightened by the show of force gained courage when the danger was past and worked steadily to restore things as they had been. France was the first to begin the revolution, and she soon began to retrace her steps. Louis Napoleon was not so dull as people thought. He had an unusual talent for intrigue, and he worked quietly and steadily for the restoration of the empire. Public opinion is fickle in France, and these efforts of Louis Napoleon received popular support. He had made the clergy his friends by interfering on behalf of Pope Pius IX., who had been driven out by the revolutionists. In violation of the constitution, the President

of the French Republic, soon after his election, sent troops to Rome to restore the government of the pope. All those who favored a monarchy in France upheld Louis in his efforts to make himself supreme, and the first legislature that came together under the constitution contained a majority of anti-

NAPOLEON III

republicans. The president filled the offices with his adherents and resorted to every device to court popularity. He posed as the people's defender against the legislature. The latter body had passed a law restricting the suffrage. This measure, by which three million citizens were deprived of their votes, gave the president a chance to discredit the legislature before the people.

He demanded the restoration of universal suffrage. His term was to expire on May 2, 1852, and according to the constitution he was not eligible to reelection. He saw that the people generally were in favor of a continuance of his government, but a change in the constitution could be made only by a vote of three fourths of the Assembly, and this majority could not be found. Accordingly he resorted to force. Early on the morning of December 2, 1851, the leaders of the opposition were seized in their beds and sent to prison. Troops closed the Assembly, and when the people awoke next day they found notices posted on the street corners announcing the dissolution of the Assembly, the reestablishment of universal suffrage, and the appointment of new elections to decide upon changes in the constitution. This was the famous *Coup d'état* of 1851. It worked perfectly. By an almost unanimous vote the people decided to extend the president's term of office to ten years, and a new constitution was formed embodying all the points on which Louis Napoleon had insisted. The constitution went

into force at the beginning of the year 1852, and before the end of that year the question of restoring the empire was submitted to the people. Again a nearly unanimous vote decided in favor of Napoleon. He became Emperor of the French under the title of Napoleon III. So the Revolution of 1848 accomplished nothing permanent. In three years a monarchy was restored, more absolute in principle than that which had been overthrown.

Italy. — The Italian revolution, which, under the leadership of Charles Albert, of Sardinia, had expelled the Austrian power from northern Italy, enjoyed but a short triumph. The revolutionary party had the same defects as in 1830. Italy was not united, and the military direction of affairs was unskillful. Charles Albert was defeated at Custoza (July 25, 1848) and at Novara (March 23, 1849). The Austrian power in Italy was restored. Charles Albert in his despair abdicated his throne in favor of his young son, Victor Emmanuel.

Germany. — The unpractical National Assembly at Frankfort made no progress toward the establishment of a new German government. For a long time they were divided on the question whether Austria should be admitted to the new Germany. When they decided to exclude her, she refused to abide by the decision. When they offered to Frederick William IV., of Prussia, the headship of the new German confederation under the title of "Emperor of the Germans," not only Austria but several of the other states said that they would not submit. Moreover, Frederick William himself refused the doubtful title. As the new constitution which they had adopted was rejected by the principal states, their work amounted to nothing. The members began to withdraw, and finally what was left of the Assembly was dissolved by force June 18, 1849. In the meanwhile an assembly was called in Prussia to draw up a constitution. It was soon at odds with the king, and was dissolved. The government published a constitution of its own making. In the other states of Germany also there were signs of reaction.

Austria and Hungary. — In Austria the difficulties of 1848-49 were complicated by the race question. In the German part of her dominions she put down the revolution, but not till after severe fighting at Vienna, the Emperor Ferdinand having abdicated in favor of his nephew, Francis Joseph. The most serious danger was caused by the Hungarians, who wanted to be independent of Austria, and by the Bohemians, who broke out in revolt at Prague. The Bohemian revolt was put down first. That of the Hungarians, under their patriot leader, Kossuth, was more formidable. The course of the Hungarians, however, was unwise, and their armies were badly managed. Russia, moreover, aided Austria against them. The insurrection was put down. Kossuth and the other leaders fled to Turkey. Those who had taken part in the revolt were treated with cruelty, the constitution was annulled, and Hungary reduced to the position of a conquered province.

Conclusion. — Apparently the liberal ideas which triumphed for a moment in 1848 had left no results. France was under a strong personal government; Germany was disappointed in her hopes for national unity; Italy was again under her old rulers; and Austria had successfully put down revolts in her own capital, in Hungary, Bohemia, and Italy. Such was the state of affairs in 1851. Yet we shall see that, as after the Revolution of 1830, the new ideas had gained ground. It was the beginning of constitutional government in several of the European states. The Holy Alliance "was riddled through and through."

CHAPTER LXX

EUROPE AFTER 1851

Introduction. — There were two great questions left unanswered by the Revolution of 1848. These were (1) the question of Italian unity, and (2) the question of German unity. Much of the history of the next twenty years is taken up with events which bore on the settlement of these questions. A third matter of importance which began to concern the European powers soon after the year 1851, and which to this day continues to absorb their attention, is the Eastern problem, relating to the European possessions of Turkey. The first great European war after 1851 arose from this issue.

The Outbreak of the Crimean War. — The weakness of Turkey was well known. We have seen that years before, the Sultan's vassal, Mehemet Ali, had defeated the Turkish government in three wars, and was in a fair way to making what disposal he liked of the Sultan's dominions, when the great powers intervened on behalf of Turkey. Many thought that the time would soon come when the Turkish empire would fall to pieces, and it was a matter of great interest who should obtain the largest share of the spoils. Nicholas I., of Russia, was especially interested in this matter. He had even hinted, while on a visit to England, that the condition of the "sick man," that is, the Turkish empire, promised to give England

and Russia an early chance to divide up the Turkish territories. He was anxious for an excuse for war with Turkey. He found one in the policy of the Turkish government in the matter of the holy places of Jerusalem. The Greek and Roman monks were quarreling over privileges of worship in the Holy Land, and especially over the possession of the key to the Holy Sepulcher. The Greek Christians possessed the key, but Napoleon III., urging the existence of a prior agreement, prevailed on the Sultan to restore it to the Roman Catholics. The Czar now assumed a hectoring attitude toward Turkey, and finally demanded a protectorate over all the Greek Christians in the Sultan's domains. The refusal of the Sultan was made by Nicholas the occasion of war. On the Sultan's side, however, were France, who had got him into the trouble, and whose emperor was anxious for war as a means of adding to his power, and England, because her interests in the far East would be endangered if Russia gained control of Turkey. Austria and Prussia were alarmed at the aggressions of Russia, but they remained neutral. Russia, therefore, had to contend single-handed against France, England, and Turkey, who were afterwards joined by the little kingdom of Sardinia.

The Crimean War and its Results. — Russia declared war against Turkey in 1853, and in the following spring the Western powers declared war against Russia. Russia first invaded the Turkish provinces in the Balkan Peninsula. This alarmed Austria, for Russian control of the Danube was a menace to her own power. Accordingly she demanded that Russia should at once evacuate the Danubian principalities, threatening war in the event of a refusal. Nicholas at first paid no attention to this, but having failed to gain a foothold in the provinces, and finding that Austria was very much in earnest, he withdrew his forces from the region, which was then occupied by Austrian troops. The allies planned to attack Russia on two sides at once. A fleet was sent into the Baltic Sea with a view to threatening St. Petersburg, and an army was directed against the Crimea on the northern coast

of the Black Sea. The northern expedition failed, and the Crimea became the seat of the war, the great object being the capture of the fortified city of Sebastopol. An allied army of French, English, and Turks landed on the western coast of the Crimea, in September, 1854, and defeated the Russians a few days later at the river Alma. The way now lay open to Sebastopol, and the siege, one of the longest and bloodiest in modern times, was begun. On October 25, 1854, was fought the

SIEGE OF SEBASTOPOL

indecisive battle of Balaklava, famous for the heroic but fruitless charge of the British cavalry, and on November 5, 1854, occurred the defeat of the Russians in the battle of Inkermann. Winter now set in, and the allies had to rely on the slow and painful methods of a siege. They had not prepared for this, and the sufferings of troops from hunger and cold were intense. Toward spring they attempted to take the Russian redoubts by storm, but the city and its outworks had been fortified by the great engineer, Todleben, and the attacks failed. After a long bombardment, however, the chief redoubts that protected

the city were taken, largely through the valor of the French, and Sebastopol, after a siege of eleven months, fell into the hands of the allies. This decided the war. Nicholas had died (March 2, 1855) and was succeeded by Alexander II., who consented to a treaty.

The Peace of Paris (1856). — The war was concluded by the Peace of Paris (March 30, 1856), by which Russia gave up her claim to be the sole protector of the Christian subjects of the Sultan (who thenceforth were to be under the joint protection of the powers), restored to Turkey the important fortress of Kars in Armenia, and gave to the Turkish province Roumania a strip of territory at the mouth of the Danube. The integrity of the Turkish empire was guaranteed, and the passage of the Danube was free to the ships of all nations. Russia, moreover, was not to have the exclusive control of the Black Sea. France had taken the chief part in the war, and she received the chief credit for the results. Napoleon III. realized his aim of making his empire respected, and for some years France held the leading place in Europe.

Sardinia. — Victor Emmanuel II., who had succeeded Charles Albert on the Sardinian throne, was liberal as a ruler and had all his father's zeal for the cause of Italian independence. In trying to gain that end he showed far more than his father's ability. He chose as his chief minister the able statesman, Cavour, whose object was not only to advance the interests of Sardinia, but to secure the unity and freedom of Italy. We have seen that the Sardinians joined the allies against Russia in the Crimean War. This was done by the advice of Cavour, who thought that it would bring Sardinia forward in European politics, and help her to throw off the Austrian yoke. His plans were aided by the neutrality of Austria during the Crimean War; for, while that power had made an enemy of Russia and done nothing to deserve the good will of the allies, Sardinia found herself on the side of the successful party and in a better position in case she should ask favors.

Louis Napoleon and Cavour. — The cause of Sardinia was also aided by the designs of Napoleon. It was his ambition to make France supreme in southern Europe. Just when France and Sardinia joined hands is not certain, but it is known that Napoleon asked the Sardinian minister, in 1855, "What can I do for Italy?" At the congress of the powers which concluded the Peace of Paris in 1856, Cavour laid before the representatives of the other nations his case against Austria. Nothing was done then, but it was soon evident that Napoleon III. was ready to take up the Italian cause. Early in the year 1858 a member of a Roman secret society, named Orsini, made a plot against the life of Napoleon. By denouncing this plot Cavour increased the French emperor's good will toward him. There was a meeting between Cavour and Napoleon at Vosges, in 1858. Napoleon would not listen to Cavour's plan for Italian unity because it was thought injurious to the pope. He wished a confederacy to be formed of which the pope should be a member. Cavour saw that, after all, the main thing was the expulsion of the Austrians from Italy, so he fell in with Napoleon's plan. In the event of success France was to acquire Savoy and Nice.

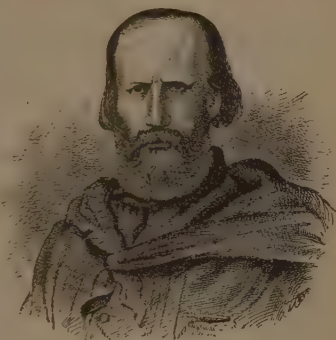

The War of Italian Independence. — After this France remained apparently friendly to Austria, although Napoleon's designs were suspected. Sardinia, on the other hand, began to prepare for war. A European congress was proposed in view of the danger, but Austria opposed this because she did not care to have her misgovernment in Italy exposed. Alarmed at the warlike preparations of Sardinia, Austria finally sent an ultimatum to that kingdom demanding the reduction of its army to a peace footing. This Sardinia refused, and war followed. Napoleon thereupon informed Austria that he would consider the crossing of the river Ticino between Lombardy and Piedmont as a declaration of war against France. As a result, France, as well as Sardinia was now at war with Austria, and the latter power had not a single ally in Europe. Napoleon announced that he would free all Italy. The campaign of the

French was completely successful. The Austrians were driven from Lombardy; the principalities of the Austrian rulers broke out in revolt, and Rome was in the hands of the French. On June 4, 1859, the French won the battle of Magenta, and about three weeks later the Austrians were defeated with heavy loss at Solferino. The result of this success was to bring Italy as completely under the influence of France as it had been under the influence of Austria. But Napoleon did not complete the conquest. He had gained almost all that he wanted, and Prussia was now threatening to interfere. It was not to his interest to carry on the war longer, and he had no mind to continue it merely for the sake of the Italians.

The Terms of Peace. — At Villafranca a truce was formed between France and Austria, and on November 10, 1859, the peace was determined at Zurich. This treaty gave Lombardy to France, who ceded it to Sardinia; allowed Austria to retain Venice; and agreed that Italy should become a confederacy with the pope as its president. Napoleon received as the price of his services Nice and Savoy from Sardinia. The results of the war were by no means satisfactory to Cavour, by whom Napoleon's failure to complete the liberation of Italy was regarded as a breach of faith. Moreover, it was a serious blow to his hopes when he found that Austria was allowed to retain Venice and the district east of the Mincio, known as the Quadrilateral from the four fortified cities which it contained.

The Unification of Italy. — From 1859 to 1871 the work of uniting Italy under the house of Sardinia went steadily on. The plan for a confederation of which the pope was to be the president failed; for to the northern states, which had been governed by the Austrian princes, was given the right to decide for themselves what should be done with them. They decided upon annexation to Sardinia. In the south the important kingdom of Naples and Sicily was still governed by a Bourbon prince. Sardinia did not wish to bring on another great war by expelling the tyrant. Her object, however,

was gained through the efforts of the patriot Garibaldi, who started up a revolt in Sicily and took possession of the island, then passed over to Naples and overthrew the tyrant. This was done without the consent of Sardinia, but that kingdom profited none the less from its results. About the same time trouble with the papal states had led to the sending of a Sardinian army into the pope's dominions, and the annexation of the greater part of them to Sardinia. Garibaldi, after his success in Naples and Sicily, saluted the Sardinian king as King of Italy, and by a vote of the people Naples and Sicily joined Sardinia. A parliament of united Italy was opened in 1861, but ten years passed before unity was complete.

CHAPTER LXXI

THE FOUNDING OF THE GERMAN EMPIRE

The Schleswig-Holstein Question. — The duchies of Schleswig and Holstein had long been united under a single duke, but upon the failure of heirs to its ducal line the government of the duchies passed into the hands of the Danish king, who, however, was required to rule them separately from Denmark. The principle was firmly established that the two duchies should never be separated, although Holstein was a vassal state of Germany, and Schleswig of Denmark. In 1846 it was evident that the male line of the Danish kings would soon be extinct, and the heir to the Danish throne traced his descent through the female line. In the duchies, however, by law, the female line could not succeed to the throne. They therefore demanded local independence. The sympathies of the German people were wholly with Schleswig and Holstein, and when the Danish king tried to incorporate the duchies with Denmark, the diet of the German confederacy sent troops to their defense. But in the reaction that followed the Revolution of 1848, an arrangement favorable to Denmark was made. Not to go into the details of the question, which is very complicated, it need merely be said that Denmark persisted in her plan against the independence of the duchies until Austria and Prussia resorted to force. The allied army of Austria and Prussia occupied the duchies in 1864, and, after a brief but sharp conflict known as the Danish War, they were taken from Denmark and left to the disposal of Austria and Prussia.

The Rivalry of Austria and Prussia. — For several years after the Revolution of 1848, Austria continued to be the leading state in Germany, and Prussia underwent many humiliations, but with the accession of King William I. of Prussia, the condition of affairs began to change. Prussia now adopted a more spirited policy. She showed her independence by refusing to

take the Austrian side in the war with France and Sardinia. Bismarck became the minister of William I., and began to carry out a far-reaching scheme for exalting the power of Prussia. In the face of persistent opposition he reorganized and increased the army, and in the direction of Prussia's foreign policy he plotted steadily against the interests of Austria. Having increased the military strength of the Prussian army, he felt that she was fit to cope with her great rival, and he cast about for a good pretext for war. He found this pretext in the dispute which arose over Schleswig-Holstein. It was agreed that the duchies should be occupied jointly by the Austrians and the Prussians, and later, at the so-called Gastein Convention, that Holstein should be governed by Austria, and Schleswig by Prussia. He soon professed to find that Austria was unfaithful to this agreement and complained to the Diet. He was bent on incorporating Schleswig-Holstein with Prussia, while Austria wished to leave the question to the decision of the Diet. This was a popular move on the part of the Austrians, but Bismarck determined to offset it by a proposal still more likely to receive popular favor. Declaring that Austria had violated her agreement in the matter of Schleswig-Holstein, he proposed that the government of Germany should be reorganized on the basis of popular representation. He proposed the calling of a convention to be elected by the vote of the people. Thus step by step the breach was widened between the two Powers. Austria finally ordered the assembly of Holstein to declare what form of government they preferred. When Prussia denounced this as a violation of the Gastein agreement, Austria appealed to the Diet against her. The Diet took the side of Austria, and Prussia declared war. Several of the German states sided with Austria.

The War of 1866. — Rarely has there been a war so quickly completed and so decisive in results. It is known as the six-weeks war. The Prussian armies were ready for instant action. In a few days the states that had joined Austria were required to disarm, and a large Prussian force moved into Bohemia,

where the main army of the Austrians had gathered. King William and his general Von Moltke left Berlin on June 30, and on the 3d of July the Prussians fought the battle of Sadowa or Königgrätz, completely routing the Austrians. By the 20th of July Prussia was able to dictate peace.

Results of the War. — Schleswig-Holstein was ceded to Prussia. Venice, the last stronghold of Austrian power in Italy, was given to King Victor Emmanuel, who had aided Prussia in the war. Treaties between the German states were formed, resulting in the establishment of a north German confederation with Prussia as its head. Thus a new German union was formed around Prussia, and Austria lost her leadership in Germany. There was now a central government for Germany, and a law-making body elected by the vote of the people. Complete German unity was now only a question of time, and in the new union the principles of constitutional government were soon firmly established. The effect on Austria herself was good. In 1867 a long-standing dispute with Hungary was settled by a compact which made the Austria-Hungarian empire a double state united in the person of the emperor, the independent local government of Hungary being acknowledged.

Napoleon III. and Prussia. — Napoleon III. saw with alarm the rapid rise of Prussia, which was now supplanting France in the position of the leading state of Europe. He tried to obtain from Prussia some cessions of lands on the Rhine, and he tried to extend his territory in another direction by the purchase of Luxemburg from Holland. In both these points he failed through the opposition of Prussia. Angered by these reverses, Napoleon was ready for war on the slightest pretext. About this time the Spanish people rose against their queen (Isabella), and established a constitutional government, electing King Amadeus to the throne. But before this the Spanish parliament offered the crown to Prince Leopold, of Hohenzollern, a relative of the Prussian king. The relationship was so slight that his candidacy was not at all likely to strengthen the power of Prussia, but France never-

theless seized upon it as a ground of objection. She demanded the withdrawal of Prussia's consent to Leopold's candidacy. To this King William assented, but France went further, and required that he should promise that under no circumstances should Leopold ever accept the crown of Spain. King William refused to agree to this, and this refusal was viewed by Napoleon as a justification of war. The real cause of war, however, was the fact that it was desired by both countries. Napoleon wished to check the demand for more liberal government by a brilliant war policy. His people, who were completely deceived as to the military condition of France, and were over-confident as to the result of the war, welcomed it as a chance to restore their country to its high place in Europe. Moreover, Bismarck secretly favored war, and did what he could to make reconciliation impossible.

The Franco-German War. — Space will not permit a full account of the military events of this great conflict. Napoleon had planned to invade Germany, but his scheme was thwarted by the rapidity of the German movements. Operations began early in August, 1870. In the battle of Weissenburg, on August 4, the French were defeated; their invading army turned back, and German troops marched into France. Two days later the French army under Marshal MacMahon, who had won his fame at the battle of Magenta, was defeated, and another victory was won by the Germans on the same day. Now the entire German army entered France. At last the forces of the French were driven in from all quarters toward Sedan, and there on September 1, 1870, the decisive battle of the war was fought. The result of it was that the French army of 84,000 was surrendered, and the Emperor Napoleon yielded his sword

EMPEROR WILLIAM

to King William. When the news of these calamities reached Paris, a republic was proclaimed and a provisional government was formed. The Germans marched on Paris and laid siege to the city. In the early days of the war a large French army had been shut up in the city of Metz, which now surrendered. The siege of Paris went on until January 28, 1871, when, baffled in all efforts to break through the Prussian lines, the beleaguered armies surrendered.

The Results of the War. — In the winter of 1870, a new form of government was established in Germany by treaties with the southern German states, and northern and southern Germany were united into an empire under the king of Prussia. King William was proclaimed Emperor of Germany in the palace of Versailles, January 18, 1871. As to France, the final terms of peace were very severe. She was obliged to give up to Germany part of Lorraine, and the province of Alsace, and to pay an indemnity of five billion francs. In March, 1871, there was a great communist uprising in Paris, against the authority of the French Assembly. The insurgents began a new reign of terror, but the forces of the Assembly took Paris in May, after much fighting, during which the insurgents burned many buildings. A new constitution was finally adopted, and the third French Republic was firmly established.

CHAPTER LXXII

ENGLAND IN THE NINETEENTH CENTURY

Reforms. — After the overthrow of Napoleon, England, like the other countries of Europe, pursued a reactionary policy opposing all attempts at reform at home, and casting in the weight of her influence with the despotic monarchies of the continent; but on the death of Lord Castlereagh in 1822, Canning assumed the direction of foreign affairs. His policy was liberal and steadily opposed to the designs of the Holy Alliance. It was his outspoken warning that deterred the European monarchies from taking part with Spain against her revolted American colonies. He recognized the independence of these colonies, and boasted that he had "called the New World into existence to redress the balance of the Old." In internal affairs also a liberal policy began to bear fruit.

QUEEN VICTORIA

The passage of the Catholic Emancipation Act in 1829 and the Reform Bill in 1832 have already been mentioned. The persistent opposition of the Tories, or, as they were now called,

the Conservatives, to the latter measure, was unavailing, and the right to vote was extended to a vast section of the population that had never before possessed it. Another great reform measure was the abolition of slavery in the British colonies in 1833 as a result of the efforts, extending over many years, of a band of earnest reformers, the leaders of whom were Granville Sharp, Wilberforce, and Clarkson. Other important reforms were the improvement of the poor laws, the extension of local rights of self-government in the towns, and the advancement of popular education. But progress was slow and moderate, and the more radical demands of the violent party known as "Chartists" were not granted, in spite of the latter's threatening outbreaks.

A very sweeping reform, which was carried into effect about the middle of the century, was the repeal of the corn laws. These laws imposed heavy duties on imported grain for the purpose of protecting the English producer. For many years there had been opposition to this policy, for England was essentially a manufacturing country, and the advantage of cheap food to those engaged in the industries was thought to outweigh that of protection to the landed classes. In the forties the leader in the agitation for the repeal of the corn laws was Richard Cobden, who was greatly aided by the eloquence of John Bright. The party became powerful, and in 1846 the corn laws were repealed, thus committing England definitely to the policy of free trade.

The English in India. — In the eighteenth century France had been a dangerous rival of England in India, but in the reign of Louis XV. her power declined, and through the military skill and statesmanship of Lord Clive the British power was established in India on a strong foundation. The British dominions were greatly increased during the administration of the Marquis of Wellesley (1798–1805) in India, whose vigorous policy, combined with the victories of his brother, Sir Arthur Wellesley (afterward the Duke of Wellington), greatly strengthened the British rule. In the years that followed,

one province after another was absorbed in the British territory, but in 1857 occurred a movement among the natives which for the moment threatened the destruction of England's Indian empire. This was the famous Indian mutiny.

The Indian Mutiny (1857). — This arose from the fanatical hatred and distrust among the Hindus and Mohammedans of India toward the British, who were thought to be planning the overthrow of the native religions. The British government had tried to repress several practices sanctioned by long custom and invested with religious veneration. They did this in the interest of a higher civilization. Thus they abolished the Hindu custom of burning widows at the funerals of their deceased husbands. The immediate occasion of the outbreak was the report that the cartridges used by the Sepoy or native troops in the Indian service were greased with the fat of animals to touch which was regarded as sacrilegious by the natives. The insurrection was planned with the greatest secrecy, and the British were taken unawares. A brutal massacre of women and children took place at Cawnpore. The British inhabitants of Delhi were murdered. Lucknow sustained a terrible siege, and was relieved by the arrival of General Havelock just in time to save it from destruction. But when the English recovered from their first surprise, they gradually suppressed the rebellion. The province of Oude was reconquered, and a cruel vengeance taken upon the rebels. The government of India was now transferred from the East India Company to the Crown, and in 1877 Queen Victoria of England assumed the title of Empress of India.

The Afghan Wars. — The British had great difficulty in maintaining peace along their frontiers. On the north the warlike tribes of Afghanistan gave them continual trouble, and in 1838 war broke out between England and the Afghans. The English tried to occupy the country with inadequate forces, and suffered a terrible reverse on retreating through the Khyber Pass (1842), where their entire army was cut to pieces. But another British force was sent into the country and took

vengeance on the natives. The Afghan ruler allied himself with the English, but after his death his son and successor sided with the Russians. At last an affront offered to the British embassy furnished the occasion for another Afghan war (1878-1881). Under General Roberts the English were successful, and installed Abdurrahman Khan (1880) as Ameer, who has remained generally faithful to the English alliance. The English interest in this Afghan matter is due to the fact that Russia has gradually extended her boundaries southward with the design of controlling the approaches to India. In 1885 the two countries seemed to be on the point of war, but it was averted by an agreement between them in accordance with which the northern boundary of Afghanistan has been determined. Nevertheless, the conflicting ambitions of the Russian and British empires in this region, and the neighborhood of these two great Powers, still remain sources of constant apprehension.

England and Ireland. — The Irish hatred of English rule was the product of long centuries of oppression. In addition to difference of race there was difference of religion; for while the native Irish population were almost wholly Roman Catholic, the English were members of the Anglican church, or Protestant dissenting bodies. Successive settlements in Ireland by English immigrants had given the best lands to the alien population. The legislation of the eighteenth century was full of the most stringent enactments against the Irish Catholics. They were not only excluded from all honors and offices, but were obliged to pay tithes for support of a Protestant Established Church, which they hated. The law against their holding office was removed, as we have seen, by the Catholic Emancipation Act of 1829. But this was only one of many grievances. The agitation for disestablishing the Irish Protestant church went on until, under the leadership of Mr. Gladstone in 1869, the act of disestablishment was passed.

A far more serious object of agitation, and one which is the occasion of party strife to this day, was the repeal of the union

between England and Ireland. A conspicuous leader in this movement was Daniel O'Connell, who aimed at self-government for his country. One of the grievances which has sharpened this agitation for home rule has been the land question. The Irish lands were in the hands of absentee owners, who left the management of their estates to agents or middlemen. These agents, whose remuneration depended upon what they got out of the land, wrung as much as possible from the tenants. The laws were in the interest of the landowners, and

HOUSE OF PARLIAMENT

if a tenant was unable to pay the rent he was liable to immediate eviction; that is, to be turned out of doors with his family at the risk of starvation. In the bad condition of the country the competition for land was so keen that the tenant would engage to pay an exorbitant rent. Accordingly he often fell into arrears, and the landowner could legally claim the entire crop, leaving the tenant only his bare subsistence. The result of this was a wretched method of farming. The condition of the peasantry was so bad that the failure of the potato crop in a single year caused the starvation of thousands of people.

Cruel evictions were followed by bloody revenges, and lawlessness prevailed. At last the English government listened to complaints and tried to improve the condition of the tenants. A land act was passed in 1860, but did little good. Another land law in 1870 attempted to aid tenants in the purchase of land. Other acts looking to this end were afterwards passed, but without checking the agitation for home rule. In 1870 a home rule party was formed, under the leadership of Isaac Butt. Later a far abler and more conspicuous leader was Charles Stewart Parnell. The policy of this party was to obstruct parliamentary legislation by every possible means, in order to compel attention to the Irish demands. Their representatives in Parliament carried out this plan with considerable success.

Home Rule Bills. — In 1886 Mr. Gladstone, the head of the Liberal party and the leading statesman of Great Britain, accepted the principle of home rule for Ireland and introduced in Parliament the first home rule bill. A section of his party, known as the Liberal-Unionists, opposed this policy, and voted with the Conservatives. The measure was defeated. In 1890 a scandal seriously damaging the reputation of Mr. Parnell led to a rupture in the party, the majority demanding his retirement from the leadership. Mr. Parnell refused to retire, and a hot fight followed between the factions. Mr. Parnell died in October, 1891, but the factional strife continued. Nevertheless Mr. Gladstone brought in a second home rule bill in 1893, and it passed the House of Commons; but it was rejected by a large majority in the House of Lords. In 1898 under the Conservative ministry of Lord Salisbury, a local government act was passed which, though by no means satisfactory to the Home Rulers, introduced many long desired reforms in the local administration of Ireland.

CHAPTER LXXIII

EUROPE AFTER 1871

The Russo-Turkish War (1877-1878). — The Crimean War had weakened Turkey's grasp on the Balkan Peninsula, but she was still able to grind several of the Christian provinces in that region under her corrupt and oppressive government. In 1875 the two provinces, Bosnia and Herzegovina, whose population was mainly Slavonic, revolted against Turkish rule, receiving aid from their kinsmen in Servia and Montenegro. Austria, Germany, and Russia interposed on behalf of these oppressed peoples, but could obtain from the Turkish Sultan nothing but empty promises of reform, and England refused to join them in the adoption of forcible measures against Turkey if the Sultan persisted in refusing redress. The reason for her action was her desire to maintain Turkey as a barrier to Russian encroachments, for she feared that the dismemberment of Turkey might imperil the British possessions in India.

In 1876 the eyes of the civilized nations were opened to the real nature of Turkish rule by events in Bulgaria, where, on the suppression of a revolt, the Turks committed the atrocious "Bulgarian massacres." Even after this, England refused to side with the Powers; and though she gave the Turkish government to understand that no aid was to be expected from

her, the Sultan appears to have counted on her assistance. At all events the Turkish government obstinately rejected all the demands of the Powers for the establishment of a better government in the Balkan provinces.

Russia finally took up arms as the champion of the provinces, and as the other Powers remained neutral, she and Turkey fought it out alone. The war began in April, 1877. The Russians invaded Turkish territory and seized Shipka Pass, an important strategic position, but the Turks, under their able general, Osman Pasha, doggedly resisted, and for a time the Russians were checked; but in December, 1877, after severe fighting, they captured Plevna, and a Turkish army of 44,000 men fell into their hands. In the following month they took Adrianople, and were ready to march on to Constantinople. In the east the Russians were also successful, capturing the important fortress of Kars. Turkey was now ready for peace, which was signed at San Stefano, March 3, 1878.

The Congress of Berlin (1878). — The terms of the treaty of San Stefano were very disadvantageous to Turkey. Her power in the Balkan Peninsula was seriously impaired. But England came to her aid in a secret treaty. England was determined to check Russian ambition, and it seemed for a time as if those two Powers would go to war; but the danger was arrested by the Congress of Berlin, where representatives of all the great Powers met to settle the points at issue. The decisions of this Congress directed the international affairs of Europe for many years. England's policy triumphed, and the corrupt and declining power of Turkey was propped up. But the Turkish influence in the Balkan Peninsula was greatly lessened. The independence of Servia, Roumania, and Montenegro, was acknowledged; Bosnia and Herzegovina were occupied by Austrian troops and were ultimately incorporated in the Austria-Hungarian monarchy; and Bulgaria became self-governing. Russia was obliged to content herself with far less than she had obtained in the treaty of San Stefano.

The Congress of Berlin did not solve the difficult problem arising from the decay of the Turkish Empire. This problem, familiarly known as the Eastern Question, long remained a menace to the peace of Europe. The main point in it was the fact that sooner or later the Turks would lose their hold on their remaining European territory, and that the great Powers of Europe were each eager for a share, or fearful lest one might gain so much as to endanger the balance of power. England and Russia, especially, watched jealously all movements affecting the affairs of Turkey; for the former feared for the safety of her distant colonial possessions, and the latter, always eager for territorial expansion, longed for Constantinople.

England and Egypt. — The next important event in European history was the settlement of the Egyptian difficulty. The Khedive, or Viceroy, who ruled the country under the authority of the Turkish Sultan, mismanaged the finances and incurred an enormous debt to the European powers. In 1876 he was obliged to give over the control of the revenue to a European commission, but his opposition to the policy of the Powers and his refusal to pay the interest on the debt led to his enforced abdication in favor of his son, Tewfik Pasha. This caused a revolt of the natives headed by Arabi Pasha, a colonel in the army, who opposed the foreign interference in Egyptian affairs. The Khedive, Tewfik Pasha, tried to avoid giving offense to the Powers, but this aroused the hatred of the nationalist party, and Arabi Pasha became the chief power in the state. England now determined to interfere, under the Khedive's authority. An English fleet under Admiral Seymour bombarded Alexandria, and an English army under Sir Garnet Wolseley crossed the isthmus of Suez and advanced into the interior. At Tel-el-Kebir the English forces met a large body of insurgents and defeated them in several bloody battles (September 13, 1882). From that time Egypt, though (until 1914) nominally a dependency of Turkey, passed under English control. English troops have been garrisoned there, and the

policy of the state has been directed by the representatives of the English government.

England and the Transvaal. — At the other end of Africa the English policy of colonial expansion was delayed by the sturdy Dutch settlers called Boers. These people had formerly occupied Cape Colony, but when England secured this region and began to send colonists there, the Boers moved out and founded new republics, known as the Transvaal (or South African Republic) and the Orange Free State. In 1877, however, the English government declared the annexation of the Transvaal to Cape Colony. The Boers protested, and then resisted by armed force. On February 27, 1881, they attacked the British at Majuba Hill and drove them from their position. At last the difficulty was adjusted in 1884 by an arrangement recognizing the right of the Transvaal to complete self-government, but securing to England the direction of its foreign affairs.

In 1896 the Uitlanders, or foreign residents of the Transvaal, largely Englishmen, planned an uprising to secure a share in the government; Dr. Jameson led a premature invasion to aid them, but was repulsed, and the movement collapsed. England carried on negotiations in behalf of the Uitlanders, and meanwhile sent troops to South Africa. The Boers, taking alarm, began war in October, 1899. Armies of the Transvaal and the Orange Free State invaded British territory, won several victories, and besieged Ladysmith, Kimberley, and Mafeking. Then the British armies were placed under command of Lord Roberts, and heavily reënforced. The besieged British towns were relieved, and the principal Boer towns were captured (February–June, 1900), but Boer forces kept up the struggle till 1902, when the two republics became British colonies.

The Partition of Africa. — The study of any recent map will show the respective limits of the European governments in Africa. It is impossible here to describe the numerous international arrangements that have defined the boundaries of these territories. In 1890 and 1891 important compacts fixed the boundaries of their respective colonies, between

England and Germany, England and France, and England and Portugal. The most extensive and rapidly developing territories are held by France and England. These two Powers have several times seemed on the point of coming to blows over conflicting claims to African lands. Italy, down to 1896, was following an aggressive African policy and had secured a sort of protectorate over Abyssinia; but this was repudiated by the Abyssinian king, Menelek, whose army routed the Italians in the battle of Adowa with great loss, March 1, 1896. However, Italy has since increased her possessions in Africa, as will be told in a later section.

The Situation in Africa in 1900.—Down to 1900 the general results of the partition left France in control of some 3,300,000 square miles of territory, Great Britain 2,300,000 square miles, and Germany 925,000 square miles. Thus France was, in point of actual area, the chief sharer of the African spoils, but since the barren region of the Sahara makes up a large part of this territory the worth of her African possessions does not correspond to their extent in square miles. In 1898 public attention was drawn especially to the rivalry between France and England on the upper Niger and on the upper Nile. The Niger question was settled by the conference at Paris in the summer of 1898. The dispute in the east was far more serious. England as the protector of Egypt had determined to recover the provinces of the Soudan, which had been wrested from Egyptian control by the Mahdist revolt, and for two years the Anglo-Egyptian expedition had been pushing its way southward along the course of the Nile, building a railway as it went. This expedition met with marked success, defeating the dervishes in two great battles, first at the river Atbara (April, 1898), and finally (Sept., 1898), at Omdurman, adjacent to Khartum; but at the moment of triumph news was brought to General Kitchener that a French force under Major Marchand was occupying Fashoda, a point on the White Nile further to the south. The demand on the part of the English that Major Marchand should at once withdraw was

couched in terms which offended French pride and for the moment war between the two Powers seemed imminent. But the French yielded the point and war was averted. It was pointed out that the ulterior aims of the two great Powers were thoroughly antagonistic, for England had long conceived the idea of a great trans-continental empire extending from the Cape to Cairo, and united by a railway line which would open communications from one end of the continent to the other, while France was said to be eager to open her line of communications directly across the continent from east to west.

Turkey. — The war of 1877 and 1878 between Russia and Turkey left the latter power in a weakened condition, and her power for evil was greatly curtailed by the Congress of Berlin. During the years 1895, 1896, and 1897 the main interest of Turkish affairs centered in the relations of the Porte with (1) Armenia, (2) Crete, and (3) Greece.

The Armenian Massacres. — The origin of the trouble in Armenia is obscure. A party was there organized to withstand Turkish tyranny, and some people have thought that the members of this party went too far and needlessly provoked acts of violence on the part of the government. Others threw the whole blame on the Turkish government. But whatever was the origin of the trouble, there can be no doubt that the course of the government was cruel in the extreme. Massacres of the Armenian peasants began in the Sasun district in 1894. Later an attempt to levy taxes on the Armenians having been repulsed, Turkish regular troops were sent into the disaffected districts and took an atrocious revenge. The representatives of the European Powers in Constantinople now drew up a scheme of reforms which they insisted that the Sultan should put into effect. He agreed to do so, but delayed, and in the meanwhile the massacres continued. Great Britain now began to advocate forcible measures, but finding some of the other Powers, especially Russia, were opposed to this, reluctantly agreed to a further delay. Early in 1896 it was declared on an investigation by the representatives of the

European states that up to that time 25,000 Armenians had been massacred. In the summer of 1896 a riot in Constantinople was followed by the massacre or expulsion of about one half of the Armenian residents of Constantinople. At last the Turkish government was obliged to yield to the demands of the Powers. It opened negotiations with the Armenian revolutionists and early in 1897 some reforms were introduced.

The Cretan Difficulty. — As a result of the Berlin Congress, the Turkish government agreed to grant Crete the right of self-government. The Cretans were dissatisfied with the way in which this promise was carried out, and the island was for several years in a state of confusion. Finally the Sultan withdrew the chief terms of his agreement. The islanders reluctantly submitted, but when their Christian governor was recalled and a Mohammedan sent in his place, they broke out in revolt. The European powers followed the same policy as in dealing with the Armenian question. They made the Sultan promise reforms and then permitted him to delay in carrying them out. The Cretans, suspecting bad faith, again broke out in revolt. The difficulty was complicated by the sympathy of Greece with the Cretan cause. The Greeks, moreover, were not satisfied that the Cretans should secure the right of self-government, but they wished Crete to be united with Greece. This naturally angered the Turks. Greece and Turkey now began massing their armies on the border of Thessaly.

The Graeco-Turkish War. — On April 9, 1897, a slight engagement occurred between the Turks and a body of Greek irregulars who had crossed into Macedonia and attacked the Turkish position. On April 18, Turkey declared war, claiming, however, that Greece was the aggressor. The Turks were greatly superior in numbers as well as in discipline. They were successful from the first, driving the Greeks back from the mountain passes and successively dislodging them from their positions at Larissa, Pharsalus, and Dhomokos. The Greek fleet, of which much had been expected, accomplished nothing.

The war was over before the end of April, and on September 19, 1897, a preliminary treaty of peace was signed.

The forces of the Greeks were ill-disciplined and badly directed, and the conduct of the war reflected little credit upon the nation. Turkey, as a consequence of it, gained a firmer position in international affairs. When the peace negotiations began, she demanded a considerable portion of Greek territory, together with a large indemnity. The powers opposed the dismemberment of Greece, but permitted what was called a rectification of the frontier, giving to Turkey certain advantageous military positions on the northern boundary. As to the indemnity, the Powers undertook the control of the Greek finances in order to insure its payment.

Thus Greece had utterly failed in its objects. Crete still continued as a dependency of the Porte, and the Cretans were obliged to content themselves now with such a measure of self-government as the Porte might be forced to grant through the pressure of the Powers. In 1898 Crete was under the control of the admirals commanding the fleets of the protecting Powers, who were governing the island provisionally until some plan for its self-government could be devised, and a governor could be chosen. The candidate most acceptable to the islanders was Prince George of Greece, but the Turkish government objected to him. On September 6, the Turks, enraged at the appointment of a Christian to an office in the custom house, made an attack upon the native Christians and the British troops in Candia. Seventeen British soldiers were killed and fifty wounded, and a general massacre of Christians followed, in which seven hundred were killed. It appeared that the only way to restore peace to Crete was to withdraw the Turkish troops.

The Powers demanded that this should be done, and in November the evacuation of the island by the Turks was completed. Toward the end of the month it was announced that Prince George of Greece was to be the High Commissioner of Crete. He assumed office on December 2, 1898.

Spain and her Colonies. — Reference has been made in an earlier chapter to the unwise policy of Spain in the government of her dependencies, and the great loss that she sustained as a result of the revolt of her American colonies in the first quarter of the nineteenth century has already been mentioned. Nevertheless, down to the year 1898, Spain possessed a colonial empire with an area of 405,455 square miles, and a population of between nine and ten millions. Of these colonial possessions the most important were the Philippine Islands, Cuba, and Porto Rico, their population alone being over nine millions. The Spanish colonial methods caused discontent among the natives of these islands, and in Cuba and the Philippines this discontent took the form of open rebellion on several occasions. In Cuba the insurrections were frequent, the most important being those of 1849–51, 1854, 1868–78, and 1895–98. The early rebellions were suppressed by the most cruel measures; but that of 1895 was more formidable, and the Spanish troops who were landed in Cuba in great numbers seemed unable to make headway against the insurgents. The latter insisted upon complete independence, refusing to accept any compromise, for their past experience had made them distrustful of Spain's promises of reform. In the meanwhile Spanish misgovernment in the Philippines had provoked a revolt there of an equally serious nature. It broke out in August, 1896, and was at first unsuccessful; but later the insurgents showed such strength that Spain found it necessary to attempt conciliation. Accepting the Spanish promises, the insurgents laid down their arms; but later, alleging the complete failure of the government to keep its word, the rebels renewed the war. Such was the state of affairs in Cuba and the Philippines at the beginning of the year 1898.

Spanish-American War; Causes. — The sympathies of the people of the United States were almost wholly with the Cuban insurgents. The war in Cuba was conducted in a manner most revolting to a people of a civilized nation. On the material side, too, the people of the United States suffered

injury by this prolonged conflict so near the American borders. There were powerful motives impelling the United States to interfere, but the government steadfastly adhered to a neutral policy. All efforts on the part of the United States government to put an end to hostilities by friendly mediation proved fruitless; and as time went on, the people of the two countries were further exasperated—the Americans because of Spain's refusal to listen to American protests; the Spanish because money and arms were secretly sent from the United States to the Cubans.

In February, 1898, the matter seemed as far from an adjustment as ever, and on the fifteenth of that month occurred an event which made war inevitable. The United States battleship *Maine*, lying in the harbor of Havana, was blown up, and 260 officers and men were killed. An investigation was made by a board of inquiry, which reported, on March 28, its belief that the explosion was due to outside causes. On April 19, Congress adopted joint resolutions, declaring the independence of Cuba, demanding that Spain withdraw her troops, authorizing the President to enforce this demand, and disclaiming any intention on the part of the United States to exercise sovereignty over Cuba except for its pacification. War immediately followed.

Events of the War.—The President issued a call for 125,000 volunteers on April 23, and the number of the regulars was raised to 61,000. The Key West squadron, under Admiral Sampson, was sent to Cuban waters to maintain a blockade. On April 25, Commodore Dewey left the port of Hongkong, with orders to proceed to the Philippines and attack the Spanish fleet lying in Manila harbor. It was at this point that the first great victory of the war was won, on May 1. Without the loss of a single man, the American fleet completely destroyed the Spanish vessels, killing between three and four hundred officers and men, and wounding nearly twice as many others. The United States now prepared to dispatch military expeditions to take possession of the islands.

In the meanwhile the mustering in of the volunteers went on; and the expedition to Santiago was set on foot, a Spanish fleet under Cervera having anchored in the harbor of that city, and the American fleet under Admiral Sampson and Commodore Schley having taken up its station at the entrance. On July 3, while the American troops were occupying the heights overlooking Santiago, Cervera's fleet attempted to escape from the harbor, and was attacked by the American fleet. The result was the destruction or capture of all the Spanish vessels, with a loss of about 600 Spanish killed, and about 1500 officers and men captured. On the fourteenth of July, Santiago and the eastern end of Cuba were surrendered, and a little later General Miles began to occupy Porto Rico. In August preliminaries of peace were signed, providing for a commission to prepare a final treaty.

The Peace of Paris, 1898. — The peace commission, composed of representatives of Spain and the United States, met at Paris on October 1. After long discussion a treaty was framed by which Spain gave up all claim to Cuba, Porto Rico, and the Philippines, and agreed to a prompt evacuation of these islands. The United States agreed to pay Spain the sum of \$20,000,000 within three months after the ratification of the treaty. Spain further ceded to the United States the island of Guam in the Ladrones. The two powers mutually relinquished all claims for damages. The treaty was signed in Paris on December 10, 1898, and ratified early in 1899.

Austria-Hungary. — Few nations of the world have shown such a variety of populations as Austria-Hungary. The antagonism between the different races was the chief political difficulty with which the empire had to contend. This antagonism was exhibited in a very marked manner during the years 1897 and 1898, when the two great divisions of the empire were discussing the renewal of the *Ausgleich*, that is, the compact by which Austria and Hungary agreed to contribute their respective quotas to the financial support of the empire. Its term was ten years, which expired in 1897; and when the

question of renewal arose, it was found to be impossible to come to any agreement as to the proper share which each should have of the burden.

The matter was further complicated by the attempt of the government to use only the Czech language in official and public business in Bohemia, and also to have it taught in the schools. The opposition of the Germans to these measures led to disgraceful rioting in the Austrian parliament, and it seemed impossible to effect a compromise.

Latin America. — The Spanish colonies in South America began their struggle for independence during the Napoleonic wars, when Spain was under French control. Buenos Ayres separated from Spain in 1810. The independence of Venezuela, Colombia, and Peru was won largely through the efforts of Simon Bolivar. Upper Peru was named Bolivia in his honor. Mexico, after several revolutions, received its independence in 1821. The independence of Brazil was recognized by the king of Portugal in 1825, after which it was ruled by its emperor, Dom Pedro I., who was succeeded by Dom Pedro II. The latter, after a long reign, was forced to abdicate as a result of the revolution of 1890, which transformed Brazil into a republic.

Australia. — The opening of Australia to British settlers followed the discoveries of Captain Cook (1769–1777), who gave the name of New South Wales to the colony which was first occupied. The earlier colonists were convicts, sent out from England to the penal colony known as Botany Bay, but as the resources of the country became known, free settlers followed, and the better lands were soon taken up by an enterprising and increasing population, immigration being especially stimulated by the discovery of gold in 1851. The main interest in the recent history of the colonies has centered in the efforts to secure some form of union. A constitution establishing a federal government for the Australians was at last adopted by the people of the separate colonies, and went into operation in 1901.

Canada. — In 1791 Canada, which had been ceded to Great Britain in 1763, was formed into the two provinces of Upper and Lower Canada. This condition continued till 1841, when the two provinces were united. In 1867 the Dominion of Canada was constituted, comprising at first Upper Canada or Ontario, Lower Canada or Quebec, Nova Scotia, and New Brunswick, and later Manitoba, British Columbia, and Prince Edward Island. By this arrangement each province was left to manage its local affairs while the central authority was vested in the Dominion Parliament and in a governor general as a representative of the crown.

Oriental Peoples. — As we have stated at the outset, the scope of the present work is for the most part limited to the history of European races, and little has been said of Oriental peoples except when they have come into direct relations with the peoples of the west. We have seen that on several occasions Europe was threatened by eastern races. The battle of Chalons in 451 A.D. checked the westward movement of the Huns. The battle of Tours in 732 A.D. turned back the tide of Arab conquest. Later, the Magyars or Hungarians, a Turanian people allied to the Huns, kept Europe in constant terror by their incursions, until finally they established themselves in the country which now bears their name. In the thirteenth century took place the great Mongolian invasion under Genghis Khan, who established a vast empire in central Asia, conquered the region to the north of the Black Sea, and defeated an army of Germans who came to the defense of eastern Europe. The Mongols withdrew from Europe, but, as we have seen, dominated eastern Russia for a period of two centuries. This Mongol empire rapidly declined, but Tamerlane, a descendant of Genghis, revived it and at the beginning of the fifteenth century wrested Asia Minor from the Ottoman Turks. But Tamerlane's empire soon fell to pieces, while the Ottomans, recovering from their defeat, continued the course of conquest which resulted in the fall of Constantinople (1453) and the founding of the Ottoman Empire in Asia Minor and

Europe. An account has been given of the relations between Turkey and the European powers, and of some aspects of the so-called Eastern Question. Before describing another and more recent aspect of that question, namely, that which pertains to the activity of the European powers in the Far East, a few words in regard to China and Japan are necessary.

Early in the thirteenth century Genghis Khan led his Mongols into China, and after a long period of warfare, a great Mongol empire was established there under Kublai Khan, the grandson of Genghis. This empire lasted for about a century, after which a line of native rulers, known as the Ming dynasty, held the throne for nearly three hundred years. The sovereign power was then seized by the Manchu Tartars, who have retained it ever since, in spite of serious opposition in parts of the empire. In 1850 this opposition took the form of a formidable revolt, known as the Taiping Rebellion, which had for one of its objects the restoration of the throne to native rulers. The rebels gained control of a large part of the country, and the war dragged on for many years, but in the end the government succeeded in suppressing the revolt (1865). During the nineteenth century the most important feature of Chinese history has been the opening of China to foreign trade. Treaties with Great Britain (1842) and with France and the United States (1844) prepared the way for commercial intercourse, and since that time the number of ports open to foreign trade has greatly increased.

The Mikados or rulers of Japan claim an unbroken descent from the hero Jimmu Tenno, who is said to have founded the dynasty in the year 660 B.C. After the seventh century A.D. the Mikados appear to have lost much of their power, and the military leadership passed into the hands of the Shoguns or generals, who finally gained control of civil affairs as well, the Mikado being sovereign merely in name.

After centuries of internal confusion and civil war, Japan developed a sort of feudal system in which the local authority was in the hands of the *daimios* or lords, who acknowledged

the Shogun as their feudal overlord. This system became firmly established in the seventeenth century and lasted till 1868, when as a result of a revolution the Mikados regained their lost power. In the sixteenth century, Portuguese sailors visited Japan, and in 1549 St. Francis Xavier introduced Christianity, but although the faith spread rapidly at first, it was checked by a course of violent persecutions. Commercial intercourse with the civilized nations of the west began in 1854, when Commodore Perry formed a treaty which opened certain ports to United States trade. Since then Japan has made commercial treaties with many nations and broken wholly with her old exclusive policy. In internal affairs also she has greatly improved. Feudalism was abolished soon after the overthrow of the Shogunate, and new institutions, framed on western models, were established. In 1889 Japan became a constitutional monarchy.

China and Japan. — War broke out between China and Japan in 1894 as a result of their conflicting interests in Korea. The hostilities began July 25, when a Japanese squadron defeated the Chinese fleet; and the war ended in May, 1895, when China was forced to make peace in order to avert the impending capture of Peking. The great inferiority of the Chinese fleet and army in all matters pertaining to discipline and organization was shown in a striking manner. Japan received a large war indemnity, and secured the recognition of the independence of Korea. She rose to the first rank among Oriental nations, and earned the respect of the Western powers as a strong and progressive state.

China and the Powers. — One of the most important problems in European politics is the so-called "Far Eastern Question," involving the destiny of the vast empire of China. In January, 1898, it was announced that Germany had gained possession of the harbor Kiao-Chau, with a tract of land adjoining. It appeared from this that Germany was determined to share in the rivalry which had been going on among the European powers for many years in connection with the acquisition of

Chinese territory. France had gained a foothold in Tonquin; Great Britain, in Hongkong; and Russia, in Manchuria. This cession to Germany was followed on March 28 by the announcement that Russia had secured from China a grant of the important military point, Port Arthur, and the neighboring city Talienwan. Great Britain and France also secured important concessions, the former obtaining the island of Wei-Hai-Wei and a district in the neighborhood of Hongkong, and the latter a bay on the southern coast of China. It seemed as if the partition of China had begun; and many thought that Great Britain had shown weakness and vacillation in permitting these concessions to foreign powers, and in taking part in the scramble herself, since it had hitherto appeared to be her policy to maintain the integrity of China. But it was pointed out that in the lands newly acquired by Germany and Russia, the policy of the "open door" was to be maintained, granting freedom of trade to the merchant vessels of other nations; and this, it was said, was all that the British government had a right to expect. On the other hand, it was urged that the policy of other nations than Great Britain would not, in the long run, be that of the "open door"; for, in the government of their colonies, the other powers had always shown a desire to confine the trade so far as possible to trade with the home country. These events gave rise to a very extended discussion involving the future of the Chinese empire and the undue extension of the power of Russia. The rivalry of the different nations brought up many irritating questions, and led to the prediction that a great European war would some day take place in that quarter of the globe.

On April 28, 1899, Great Britain and Russia made an agreement whereby, so far as the influence of these two powers was concerned, Russia was to obtain the railway concessions north of the Great Wall, and Great Britain those in the Yangtse valley; but both powers declared that they would not encroach upon China's sovereignty.

In 1900 there began in northern China a native agitation

against the foreigners and the Christians. Outbreaks occurred in many places, chiefly by the "Boxer" society; the Chinese troops could not or would not restore order; and soon even Peking was the scene of riots. The European powers, Japan, and the United States sent a few troops from the coast by rail to guard the embassies in Peking, but later the railroad was destroyed. The allied forces took and held the city of Tientsin (July 14), after severe fighting. Thousands of troops were hurried to the scene of hostilities, and rescued the foreigners in Peking. The powers then entered into negotiations with China, and secured a large indemnity.

CHAPTER LXXIV

THE TWENTIETH CENTURY

The Russo-Japanese War.—The suppression of the Boxer revolt did not insure peace in the Far East. When the allied forces were withdrawn, Russia retained possession of Manchuria, contrary to her promises. Japan considered her integrity as a nation threatened by this advance of Russia toward the

A JAPANESE
SOLDIER

South. Korean independence also seemed endangered. No satisfaction could be obtained through diplomatic channels, and in 1904 war broke out between Japan and Russia. The latter country had completed a great trans-Siberian railway, over which she hurried several hundred thousand troops to hold Manchuria. She had on the Pacific a number of cruisers and battleships. But on the 8th of February, 1904, the Japanese attacked, without warning, the Russian war vessels at Chemulpo and Port Arthur and sank or crippled several of them. Thenceforth Japan retained command of the sea. On February 10, she formally declared war against Russia. Three large Japanese armies were hurried into the field. Korea was quickly occupied,

the Russian army was driven northward toward Mukden, and the siege of Port Arthur was begun. This lasted seven months, and was distinguished by desperate assaults, accompanied by frightful loss of life on the part of the besiegers and by heroic resistance and terrible suffering on the part of the Russian defenders. The fortress surrendered on January 1, 1905.

Meanwhile the main Russian army, under Kuropatkin, was opposed by the other Japanese forces and was defeated in the great battles of Liao-Yang and Shakhe. Finally the Japanese general, Oyama, won the decisive victory of Mukden (March, 1905), in which the Russian losses were over 100,000 in killed and wounded and prisoners. A second Russian fleet, sent from Europe, was annihilated by Admiral Togo in the Korea Strait. Most of the Russian vessels were old, the crews were mutinous, and but few of the officers were capable. Only slight injury was inflicted on the Japanese ships. This defeat destroyed Russia's hope of success.

At the suggestion of President Roosevelt both powers sent representatives to a meeting to discuss terms of peace. Japan, though victorious on sea and land, was nearing exhaustion financially, and demanded an indemnity for the cost of the war. Russia refused to pay any indemnity whatever. Finally, on September 5, 1905, the two Powers made (at Portsmouth, New Hampshire) a treaty giving Japan Russia's interest in the Liao-tung peninsula, the southern half of the island of Sakhalin, and administrative control over Korea. Russia agreed to withdraw from Manchuria.

The war is noteworthy for the advances in sanitation and military hospital work shown by the surgeons of both armies, especially by the Japanese. There were fewer losses of life through disease than history recorded as occurring in any other war of equal proportions.

Russia. — During the war with Japan the Russian people were angered by the venality and incompetence of government officials, and showed their discontent in several revolutionary outbreaks. Money appropriated for purchasing war materials had been stolen by high-placed bureaucrats. Grand dukes had looted the Red Cross treasury. Disaster after disaster, due to official ignorance and incapacity, had overtaken both army and navy. The fire of revolt spread through the empire. Forced by public opinion, the Czar agreed to summon an elective assembly, or *Duma*. Later on he announced that the Duma

would have only advisory powers. Then the working classes utilized their most effective weapon—a general strike. In a few days all business was paralyzed. The Czar was compelled to decree freedom of speech and of religion. He also promised that thereafter no measure should become a law unless approved by the Duma.

The first Duma met on May 10, 1906. It demanded freedom for political prisoners, universal suffrage, a responsible ministry, and the compulsory sale of land to the peasants. These reforms were too radical for the government's consideration, and the assembly was dissolved. On March 5, 1907, the second Duma convened. It also was too progressive and was dismissed. Then the Czar, in violation of his promises, restricted election rights to supporters of autocratic rule. Meanwhile the Council of the Empire had been transformed into a second legislative chamber. But even this third Duma showed some signs of independence and was also dismissed by the Czar. A fourth Duma, called together in September, 1912, proved servile enough to satisfy even Russia's autocrat. Absolutism and bureaucracy, with all their attendant evils, again held sway over unfortunate Russia.

The Chinese Republic.—The world has seen few more wonderful political changes than the transformation of China's ancient despotism into a republic. Thoughtful Chinese had long noted the weakness of their government. They had seen China, a nation of 400,000,000 people, crushed in war by Japan. Foreign governments had insolently seized Chinese territory. A nationalistic uprising, the Boxer rebellion, had been suppressed by foreign troops. Peking's "Sacred City," the home of the Imperial Family, had been looted by foreigners. In the Russo-Japanese war both sides had wantonly insulted China. But reverence for the Emperor, known as the Son of Heaven, and the people's inveterate conservatism delayed the desperately needed reforms. Revolts in the provinces grew in number and violence. Finally the Throne permitted a senate to convene in Peking. But as this

body had no legislative power and could therefore accomplish nothing, it soon dissolved. Then the revolutionists took up arms, and after some severe fighting, forced the government to ask for an armistice. Meantime a provisional Republican government had been declared in Nanking under Sun Yat Sen as president. In Peking the Imperialist leader, Yuan Shih Kai, held command of a large number of troops, and he attempted, but in vain, to get the Revolutionists to compromise on a constitutional monarchy. Even the advisers of the Throne saw that only a republican form of government would satisfy China, and they suggested abdication. On February 12, 1912, the Emperor, through his ministers, resigned, and thus the Manchudynasty, the oldest on the globe, passed away. Three days later the Nanking Republican Assembly unanimously elected Yuan Shih Kai provisional president. To avoid factional disturbances, Sun Yat Sen patriotically declined to be a candidate.

YUAN SHIH KAI

A situation of extraordinary difficulty confronted the new government. Central China was overrun by a vast rabble of soldiers, commanded by disloyal generals, who pillaged friend and foe alike. Funds were urgently needed, but it was considered unwise to attempt to borrow abroad. Warned by the Boxer war, the Republic's statesmen decided to give no outside nation a chance to interfere with China's independence.

The first parliament met on April 8, 1913, and appointed a committee to draft a constitution. When this instrument was

submitted, Yuan Shih Kai violently opposed its adoption. He asserted that it reduced the president to a mere figurehead. A protracted quarrel ensued between the Radicals and Yuan Shih Kai, who was supported by the aristocracy and the wealthier classes. On January 11, 1914, the President dissolved the Parliament, and then ruled the country almost as dictator.

Persia : The Revolutionary Movement. — In 1905 a revolt was started in Persia against the Shah's misgovernment and the extortion practiced by his ministers of state. Finally the Shah signed a rescript authorizing the calling of a National Council which should have exclusive control of financial affairs and internal administration. A committee of Nationalists framed a constitution, which received the signature of the Shah. But he soon tried to gather all political power again into his own hands. An uprising supported by all classes compelled him to abdicate (July 16, 1909). The Nationalists chose as his successor his son, Ahmed Mirza, a child of eleven years. A prominent Nationalist was appointed regent. In December, 1911, the regent issued a rescript declaring the session of the National Council ended. No election has since been held, and the government is carried on by a cabinet composed of seven members.

Persia's finance and foreign commerce have long been largely controlled by Russia and Great Britain. These powers came to an agreement in 1911 to consider Persia divided into three spheres: the northern part of the country to be under Russian influence, the central portion to be neutral, and the southern part British. The British sphere includes the Persian Gulf. Hence Great Britain still controls most of Persia's sea trade and can prevent any other power from obtaining a port on the Gulf.

Turkey. — The Turkish province of Macedonia, being disturbed by rioting among the different races inhabiting it, and pillaged by Turkish troops, became eager to throw off the Sultan's yoke. A party composed of progressive Mohammed-

dans, calling themselves Young Turks, was formed. At first they worked secretly, their headquarters being in Paris. After a time they won over most of the army officers. In July, 1908, the Turkish generals of the Saloniki garrison announced their intention of attacking Constantinople unless the Sultan restored the short-lived constitution of 1876. Learning that most of the army was disaffected, the Sultan hastened

YOUNG TURKS MARCHING ON CONSTANTINOPLE

to comply. Elections for parliamentary deputies were ordered. Shortly thereafter Bulgaria declared itself forever free and independent of Turkey, and Austria-Hungary formally annexed Bosnia and Herzegovina. Turkey protested to the Great Powers, but times had changed since the Berlin Congress was held (page 548), and a small money payment was all the compensation awarded to the Sultan's government.

After the Turkish Parliament had opened, Abd-ul-Hamid, the aged Sultan, aided by the more bigoted Mohammedans of Constantinople, started a counter-revolution. This was promptly suppressed. Then both houses of Parliament de-

posed Abd-ul-Hamid, and elected as his successor, his brother, who took the title of Mohammed V (April 27, 1909). Dissensions soon arose among the party in power. The army, unpaid, showed signs of disaffection. Suddenly Italy demanded the Turkish province of Tripoli, in Africa. Italian merchants there had suffered mistreatment at the hands of Turkish officials—such was the reason given for Italy's demand. Turkey refused, and war followed. Before it was finished, Bulgaria, Servia, Greece, and Montenegro declared war on Turkey. They purposed to drive the Turks from Macedonia.

The Sultan at once gave up Tripoli to Italy and prepared to fight the Balkan allies. But his army had become disorganized, and victory after victory crowned the work of the allies, and the extinction of the Ottoman Empire seemed near. Then the Great Powers intervened and compelled a cessation of hostilities. A treaty of peace was signed in London. Greece and Servia, however, decided that Bulgaria had been given too much of the conquered territory and declined to carry out their agreement. Thereupon Roumania claimed, as a reward for her neutrality, a portion of Bulgaria bordering on the Black Sea. War broke out in which Turkey also engaged. Bulgaria acknowledged defeat, and at Bukharest entered into a treaty granting the allies most of their demands. A few weeks afterwards Bulgaria returned to Turkey territory that had been reoccupied by Turkish troops. Savage fighting had occurred in both these Balkan wars and each side accused the other of having committed frightful atrocities. On January 15, 1912, the first Turkish Parliament was dissolved.

As a result of the Balkan wars each of the Christian states has enlarged its territory, and a new state, Albania, has been carved out of the Ottoman Empire.

It is estimated that these two short wars cost 400,000 lives and \$1,500,000,000.

France: Separation of Church and State.—In 1789 the first French Assembly confiscated all lands and buildings belonging to the Catholic Church in France. Six years later it was

decreed that salaries should no longer be paid to any clergyman of any religion. Napoleon partly restored, in 1801, the pre-Revolutionary arrangement with the Church. He agreed with the Pope to pay salaries to the priests and bishops provided these should be appointed by the government. But all church buildings and lands were to remain state property. This agreement became known as the *Concordat*. It proved acceptable to the French kings; for the French clergy have always been strong supporters of a monarchical form of government.

Under the Republic great dissatisfaction arose over the relations of Church and State. The anti-clerical party charged that pupils in the Catholic parochial schools were taught sentiments hostile to the Republic. The non-teaching orders of the clergy were accused of intriguing to restore the monarchy, which had brought France to ruin in 1870. So strong did the opposition to the Church grow that in 1905 the Concordat was annulled, complete separation of Church and State was decreed, and the monks and nuns were expelled. These laws were violently opposed, but they have been indorsed by the majority of the people at all the general elections held since 1905.

Norway and Sweden were united under one king in 1814, but each had its own parliament and laws. When, in 1905, King Oscar II vetoed a Norwegian bill for a separate consular service, the Norwegian parliament declared the union dissolved. A popular vote ratified this act, and a prince of the Danish house was chosen king of Norway, with the title of Haakon VII.

Portugal.—On February 1, 1908, King Carlos of Portugal and the Crown Prince were assassinated while riding in a Lisbon street. Their deaths marked the climax of popular anger at the reckless extravagance and persistent disregard of the people's rights on the part of the government.

The king's second son succeeded to the throne under the title of Manoel II. But he lacked the ability to rule a discontented people. His advisers belonged to the aristocracy and

could not see the rising storm. A regiment in Lisbon raised the standard of revolt. Navy officers and citizens joined them. Some street fighting ensued and the war vessels in the harbor bombarded the royal palace. The king fled to England. On October 5, 1910, the republic was proclaimed and a provisional government established. Investigation showed that government officials had looted the national treasury. Over \$7,000,000 of city money had been stolen from Lisbon.

On August 20, 1911, a constitution was adopted. It provides for a parliament representing all classes. The republican government decreed freedom of religion and separation of Church and State, expelled the monks and nuns, and confiscated the property of their orders. These measures excited the anger of the Catholic clergy and their supporters. Joining forces with them, the adherents of the monarchy have succeeded in fomenting several serious uprisings against the republic. There is, however, but little prospect of the re-establishment of monarchical rule, though the present government has some serious problems to settle.

The Moroccan Embroglio.—During the early years of this century wild tribesmen of Morocco frequently invaded the French colony of Algeria, destroyed villages, and murdered traders. In 1904 an Anglo-French agreement was signed which allowed France certain administrative rights over Morocco. Germany objected to this arrangement on the ground that her commercial interests were endangered. A conference of nations was held at Algeciras, Spain, in 1906, and the disputed points were settled. In 1910 several powerful tribes rose against the Sultan of Morocco, Mulai Hafid, and besieged his capital, Fez. At his request a French force was dispatched to his aid. The rebels were routed, but a few months afterwards the Sultan resigned, a pension of £14,000 a year being awarded him by France. He was succeeded by his brother, Mulai Yusef. Germany, again asserting that her economic interests in Morocco were in danger of serious injury, sent a cruiser to Agadir, a Moroccan port on the Atlantic.

War might have broken out between France and Germany had not Great Britain sided with the French Government. Germany consented to a French protectorate over Morocco and received, as compensation, a portion of French Equatorial Africa.

Great Britain. — Queen Victoria died on June 22, 1901, aged nearly 82 years. She had reigned 62 years, 7 months, and 2 days — the longest reign in English annals. While she was queen, the British Empire increased greatly in both territory and population, the rights of the nobility were curtailed, and the political power of the people was much enlarged.

Queen Victoria's successor, the Prince of Wales, took the title of Edward VII.

An important event in the second year of his reign was the signing of the Treaty of Vereeniging on May 31, 1902. This ended the Boer War in South Africa.

An Irish Land Act passed by Parliament in 1903 permits Irish farm tenants to purchase their holdings. The prices are to be fixed by a state board of officials. Buyers may borrow the purchase money from the government and repayment may be made in installments distributed over a long period of years. This Act has done much to quiet political agitation among the agricultural classes of Ireland.

The advantages derived from the Anglo-French Agreement, as shown in the peaceful settlement of the Morocco trouble, suggested the formation of the Triple Entente (France, Great Britain, and Russia). Like the Triple Alliance (Germany, Italy, and Austria-Hungary) its professed aim was the preservation of the European balance of power.

In 1908 the British South African colonies united under the name of The Union of South Africa. The Cape of Good Hope (Cape Colony), Natal, the Transvaal, and the Orange River Colony entered the Union, under the names above given, except that the last named province is now known as the Orange Free State Province. A Parliament consisting of a

Senate and a House of Assembly constitutes the legislative power. The Governor of the Union is appointed by the British Crown. He is assisted by an Executive Council chosen by himself. Suffrage is granted to white men only. Both the English and the Dutch language are official. Despite severe labor troubles the Union is gaining in population and wealth.

With the rise of the Labor Party in Great Britain to political importance public attention has been called to the imperative need of certain social and economic reforms. An Old Age Pension Bill became law in 1908. It grants a pension of five shillings a week to all needy persons over 70 years old, if they come within the scope of the Act. The National Insurance Act, passed in 1911, guarantees its beneficiaries certain small payments in case of disability, sickness, or unemployment. A larger amount is due on the death of the insured. Only employees are entitled to the benefits of the Act. About half the funds are contributed by the working classes, and the other half is given in equal parts by the employers and the government.

When the House of Lords rejected the Finance Bill of 1909, the Liberal Party, then in power, declared the action of the Lords was unconstitutional and dissolved Parliament. The newly elected House of Commons again showed a large Liberal majority. The Finance Bill was then again voted by the Commons and sent to the Lords. The Cabinet notified them that, if they refused to pass the bill, the king had promised to create enough new peers to insure the bill's passage through the House of Lords. Rather than have their order swamped by a large number of new peers, the Lords yielded and voted for the bill. This surrender of the hereditary legislators to the elected legislators showed the advance of the power of public opinion. It was also enacted by the Commons (1911) that a bill passed by them at three successive sessions held within two years should be law on receiving the royal assent. Another important measure was the limiting of

the duration of Parliament to five years instead of seven years.

King Edward died on May 6, 1910. His successor, the Prince of Wales, took the title of George V. He is personally popular and has seen much of the world, having been a naval officer for several years.

In 1914 the struggle for Irish Home Rule (page 546), which had lasted for so many years, brought about the passage of a Home Rule Bill. There was opposition to it in northern Ireland, however, and on the outbreak of the World War it was suspended and never went into effect.

The Hague Conferences. — Toward the end of the nineteenth century, the increasing burden of military and naval armaments which weighed heavily on the Powers of Europe gave rise to a movement advocating the general reduction of armaments and the settling of disputes by arbitration instead of by war. In 1899 the First Peace Conference, called together by the czar of Russia, and attended by delegates from many countries, took place at The Hague. At this Conference a Hague Tribunal was established for the purpose of settling such disputes as might be submitted to it by different nations.

In 1909 a Second Peace Conference took place. This also was called by Czar Nicholas II and was attended by the representatives of forty-seven countries. No definite action was taken on the very important question of the limitation of armaments. Nor was any agreement reached regarding the compulsory arbitration of disputes between governments. Nevertheless the Conference accomplished much good by adopting several humanitarian rules that were calculated to alleviate the horrors of war.

How the World War Began. — In June, 1914, the crown prince of Austria was assassinated while riding in the streets of Serajevo in Bosnia. This crime was committed by a subject of Austria-Hungary who was of the Serbian race; and the reasons for his act have never been satisfactorily explained.

Austria, having long wished for a pretext to annex a portion of Serbia, accused the Serbian government of aiding the assassin. She demanded not only the swift punishment of all who were connected with the crime but also that Serbia should submit to certain humiliating conditions which were equivalent to surrendering her independence.

The reply of the Serbian government to these demands was unsatisfactory to Austria, who at once declared war. In doing this she was advised and supported by the German kaiser, whose ambition for many years had been to increase his own power and influence by inciting a general war. Russia, feeling bound by ties of race and religion to aid Serbia in case of attack, began to mobilize her army. Then, immediately, Germany, as the friend and sponsor of Austria, declared war both upon Russia and upon France, with whom Russia was allied. Meanwhile Great Britain was using every effort to prevent war; and the British government urged that a convention of all the Powers should be called to endeavor to settle the dispute in a peaceable way. To this plan, however, Germany flatly objected; and the kaiser at once put his armies in motion for the invasion of France and Russia.

The First Great Battle. — The easiest route from Berlin to Paris was through the little kingdom of Belgium, whose neutrality had long before been guaranteed by all the Powers, including Prussia, the predominant state of Germany. But the German kaiser had no respect for guarantees or treaties. In a few days his armies had overrun nearly the whole of Belgium, captured her chief cities, and thus cleared the way into France. The French, unprepared for the war that had so suddenly been forced upon them, were obliged to fall back towards Paris; and the capture of that city seemed inevitable. At this juncture Great Britain came to the rescue with a small force hastily brought across the Channel; and early in September the flood was stayed. In the battle of the Marne, the French under General Joffre, aided by a few detachments of British, defeated the Germans and drove them back to the line of the

river Aisne, where they began to throw up intrenchments and fortify themselves.

The War Spreads.—The war was soon raging on many fronts and in many lands. Bulgaria and Turkey allied themselves with Germany and Austria, and aided in the crushing of Serbia and Montenegro, and afterwards of Roumania. Japan, coming to the aid of Great Britain and her friends, called the Allies, captured the German possessions in China and the Pacific Ocean. Italy, after some hesitation, entered the war on the side of the Allies, and there was much hard fighting on her northeastern border. In Greece a great many of the people desired to aid the Allies, but in this they were thwarted by their pro-German king, Constantine, who was a brother-in-law of the kaiser. In the third year of the war, however, Constantine was forced to abdicate,¹ and Greece soon entered the war. In Egypt, the khedive, who was faithful to the Turks, was deposed by the British, and his uncle, who was friendly to the Allies, was made the nominal ruler of that country. In western Arabia, many Arabs who were dissatisfied with Turkish rule revolted and set up the independent kingdom of Hedjaz. In India, where Germany had counted upon a great uprising against British rule, the native princes as well as the masses of the people remained loyal. In 1917, a British army pushed its way up the Tigris River and captured Bagdad. At about the same time another British expedition advanced into Palestine and took possession of Jerusalem. The war spread until nearly every nation on the globe seemed to be engaged in it.

Never had there been such fighting. In western Europe, from the Belgian seacoast to the borders of Switzerland, there were two lines of opposing trenches protected by barbed wire and machine guns and filled with fighting men. On the east front similar lines extended for more than a thousand miles from the Baltic to the Black Sea. And everywhere, on land,

¹ By a plebiscite, or vote of the people, in 1920, Constantine was recalled to his throne.

in the air, in the sea, there was fighting. Frequently there were battles between armed airplanes thousands of feet above the earth. Air raids were made at long distances from the field of war; and the Germans caused frequent and great alarm by dropping bombs into London and Paris and upon the seacoast towns of England.

The Submarines.—Early in the war, and because of her naval inferiority, Germany had conceived the idea of submarine warfare, or war carried on with vessels so constructed as to be manipulated under water. A strong fleet of these vessels was equipped for service, and the Germans built great hopes upon their successful use in destroying the commerce of other nations. A war zone was proclaimed around the British Isles and an announcement was made that Allied ships found there would be destroyed and neutral vessels venturing into this zone would do so at the risk of being sunk. President Wilson of the United States protested, and warned Germany that if any American ships were sunk or American lives lost, she would be “held to a strict accountability.” In May, 1915, the British passenger steamer *Lusitania* was sunk without warning, and without any provision for saving the lives of her passengers and crew, as required by international law. More than a thousand noncombatants, including over a hundred Americans, were drowned. President Wilson again protested, and after long delay secured a promise that such destruction of merchant ships without warning should be stopped. It was stopped for a time, but at the end of January, 1917, Germany announced that thereafter all ships found in the war zone about the British Isles would be sunk without warning. President Wilson then dismissed the German ambassador at Washington and thus severed relations with Germany. A few weeks later, Congress was convened to consider the question of war or peace. On the 6th of April a state of war was declared to exist between the United States and the Imperial German Government, and preparations were immediately begun to raise, equip, and transport

an immense army capable of meeting the situation in no half-handed manner. By the end of the first year of our participation an army of 1,500,000 men was ready for service under the command of General Pershing. Of these, more than 300,000 were then performing active duty in France. Before the end of the war more than 2,000,000 of our soldiers reached France, and more than 1,300,000 saw actual fighting.

The submarine attack on merchant ships for a time imperiled the Allied cause. Hundreds of Allied and neutral ships were sunk. But hundreds of new ships were built, and the British and other navies soon learned how to cope with the submarines, by the use of airplanes, swift destroyers and depth bombs, deceptive painting of ships (camouflage), and a system of convoys in the waters most infested.

Americans in France.—Meanwhile there were internal troubles in Russia. The czar, Nicholas, was deposed and an attempt was made to set up a democratic Russian republic. But this plan was foiled by the extreme Socialists called Bolsheviks, who seized upon the government and made a shameful treaty of peace with Germany at Brest-Litovsk early in 1918. This made it possible for Germany to send more troops into France and Belgium. She was enabled also to begin a series of "drives" which, at heavy cost, forced the Allied armies back until part of the line was within forty miles of Paris. There, being reinforced by American marines and soldiers, they made a successful and final stand, and under the skilful leadership of Marshal Foch, the Allied supreme commander, they began to drive the Germans back. Until August, 1918, the American soldiers fought in the French and British armies. Then most of them were brought together and organized as the First American Army and were placed under the direct command of General Pershing. From that time onward, they won great honor on several fields—at Chateau-Thierry, at St. Mihiel, in the Argonne Forest, by the river Meuse—and wherever they went, the name American was the synonym for dashing bravery and untiring perseverance.

The End of the War. — At length, Germany, being at the end of her resources and beaten on every field, was ready to beg for peace. The imperial government was overthrown; the kaiser fled to Holland and abdicated, and a republican government was set up at Berlin. Overtures for peace were made to the Allied Powers, and on the 11th of November, 1918, an armistice was signed which ended the fighting. Bulgaria, Turkey, and Austria had already surrendered.

The great World War had brought ruin to a large part of Europe. "On both sides, the costs had been too great for computation. More than ten million soldiers had perished and twice as many had been wounded. A large part of Europe's accumulated wealth had been destroyed; millions of civilians had perished from war causes; and the population of whole countries had been seriously undermined in health and morale by the privations and habits incident to four years of the most terrible war known in history."

The Peace Treaty. — In January, 1919, delegates from twenty-seven nations met at Paris for the purpose of framing a treaty of peace to which the new government of Germany was required to give its assent. Most of the great questions that came before this convention were decided by the five principal powers — the United States, Great Britain, France, Italy, and Japan. The smaller nations were permitted to take part in the debates and to wield such influence as their relative importance demanded. After weeks of discussion, a treaty was finally drawn up and signed in the historic palace of Versailles.

By the terms of this treaty, Germany was required to pay many billions of dollars in partial reparation for the destruction wrought by the war. Alsace and Lorraine were restored to France. The great coal mines of the Sarre Basin were also given to France, but the district was placed for fifteen years under control of the League of Nations. Poland became an independent nation with an outlet to the Baltic through the free city of Danzig. The German colonies in Africa, Asia, and the Pacific Ocean were divided among the British Empire,

France, Belgium, and Japan, subject to "mandates" of the League of Nations. The German army was reduced to a force of 100,000 men; and her navy was cut down in like proportion.

To insure the fulfillment of the obligation thus placed upon Germany, the left bank of the Rhine River was to be occupied by the Allied Powers for a period of fifteen years; and no German fortifications or army movements were to be permitted within a stated distance from the right bank of that stream. The German fortifications on the island of Helgoland in the North Sea were completely demolished.

Treaties with the other warring states were made later. The Austro-Hungarian monarchy ceased to exist. Austria, very much reduced in size and shorn of all her power, adopted a republican form of government, as did also Hungary. The ancient state of Bohemia, with other provinces of similar language, became the republic of Czechoslovakia, with Prague as its capital. Roumania was doubled in size and Serbia was expanded into the present Yugoslavia. European Turkey was left with little more than the city of Constantinople, and Asiatic Turkey was reduced to half its former size, by the loss of Hedjaz, now an independent kingdom, and Mesopotamia, Syria, and Palestine, which were to be "mandatories" of the League of Nations.

What is the League of Nations? It is an association of nations for the purpose of mutual defense and the prevention of war. Disputes between the nations are to be settled peaceably by arbitration. National armaments on sea and land are to be reduced. This League of Nations began its existence in January, 1920. Great Britain, France, Italy, and Japan were its leading and most powerful members; and during the year most of the smaller states in every part of the world joined it until it included forty-eight members. President Wilson, on behalf of the United States, took a prominent part in forming the constitution of the league, which was part of the treaty with Germany; but he failed to secure its ratification by the Senate of the United States.

SYNOPSIS FOR REVIEW

THE TWENTIETH CENTURY. The Russo-Japanese War: Russian occupation of Manchuria. Japan protests. The Japanese attack and defeat the Russians on land and sea. — Russia: Popular revolts. The Duma. — The Chinese Republic: Emperor forced to abdicate by revolutionists. Republic established, and Yuan Shih Kai chosen president. Persia: The Revolutionary movement. Controlled by Great Britain and Russia. — Turkey: Young Turks. Parliament meets. Sultan abdicates, and new Sultan ascends throne. War with Italy. War with Balkan Allies. War among Balkan Allies. — France: Separation of Church and State. — Norway and Sweden: Separation. — Portugal: The Revolution. — The Moroccan Embroglio: Germany's objection to French control of Morocco. Agreements among the Powers. — Great Britain: Death of Queen Victoria. Edward VII ascends throne. Irish Land Act. Formation of Triple Entente. Union of South Africa formed. Social and economic legislation. Power of House of Lords curbed. George V ascends throne. Irish Home Rule. — The Hague Conferences. — The World War: causes; extent; nations involved; peace treaties.

APPENDIX

LIST OF BOOKS FOR READING AND REFERENCE

THE following list of books is prepared with special reference to the wants of teachers and pupils, and to afford a guide for the selection of works suitable for further reading and study in connection with the text-book. The list contains in general two kinds of books: first, the best elementary and comprehensive works on the subjects treated in the text; and, secondly, some of the most important historical works in the English language, with which the student should be more or less familiar. Of the elementary works, those which are considered the best adapted for the student are indicated by the single asterisk (*); and of the larger standard works, those which will probably prove most useful for purposes of reference are indicated by the double asterisk (**).

This list is arranged in the general order in which the subjects are treated in the text, and contains the following classes: I. General History; II. Ancient and Oriental History; III. Grecian History; IV. Roman History; V. Mediaeval History; VI. Modern History; VII. Special Modern Countries.

I. GENERAL HISTORY

History, General.

- *Adams, C. K. Manual of Historical Literature. N. Y. 1889.
- Adams, G. B. European History: An Outline of its Development. N. Y. 1899. (With bibliographical notes.)
- Allen, W. F. History Topics for the Use of High Schools and Colleges. Bost. 1870. (With a bibliography.)
- Andrews, E. B. Brief Institutes of General History. Bost. 1887. (With bibliographies.)

- Brewer, E. C. *Historic Note-book with Appendix of Battles.* Phil. 1892.
- *Duruy, V. *General History of the World.* N. Y. 1898.
- *Fisher, G. P. *Outlines of Universal History.* N. Y. 1885.
- Freeman, E. A. *Outlines of History.* N. Y. 1873. (*Freeman's Hist. Course.*)
- Heilprin, L. *Historical Reference Book.* N. Y. 1885.
- **Larned, J. N. *History for Ready Reference, with Maps.* Springfield, 1894. 5 vols.
- *Ploetz, C. *Epitome of Ancient, Mediaeval and Modern History.* Bost. 1884.
- Putnam, G. P. *World's Progress: An Index to Universal History.* N. Y. 1883.

SPECIAL TOPICS

Anthropology.

- Quatrefages, A. de. *The Human Species.* N. Y. 1879. (*Internat. Sci. Ser.*)
- Topinard, P. *Anthropology.* Phil. 1878. (*Libr. Contemp. Sci.*)
- *Tylor, E. B. *Anthropology: An Introduction to the Study of Man and Civilization.* N. Y. 1881.

Archaeology.

- Joly, N. *Man before the Metals.* N. Y. 1883. (*Internat. Sci. Ser.*)
- *Keary, C. F. *Dawn of History: An Introduction to Prehistoric Study.* N. Y. (With bibliographical notes.)
- Lubbock, J. *Origin of Civilization and Primitive Condition of Mankind.* N. Y. 1882.
- *Primitive Times.* Lond. 1872.
- Mason, O. T. *Woman's Share in Primitive Culture.* N. Y. 1894.
- **Tylor, E. B. *Primitive Culture.* Bost. 1874. 2 vols.
- *Researches into the Early History of Mankind.* N. Y. 1878.

Art.

- *D'Anvers, N. *Elementary History of Art: Architecture, Sculpture, Painting, Music.* N. Y. 1884.
- De Forest, J. B. *Short History of Art.* N. Y. 1881.
- Fergusson, J. *History of Architecture.* Lond. 1873. 4 vols.
- **Lübke, W. *History of Art.* Lond. 1869. 2 vols.
- Rosengarten, K. *Handbook of Architectural Styles.* N. Y. 1876.
- Turner, F. C. *Short History of Art.* Lond. 1889.

Ethnology.

- Brace, C. L. *Races of the Old World: A Manual of Ethnology.* N. Y. 1870.

Brinton, D. G. *Races and Peoples: Lectures on Ethnology.* N. Y. 1890.

*Peschel, O. *Races of Man and their Geographical Distribution.* N. Y. 1885.

**Ratzel, F. *History of Mankind.* Lond. 1896. 2 vols.

Reclus, E. *Primitive Folk: Studies in Comparative Ethnology.* N. Y. 1891. (Contemp. Sci. Ser.)

Historical geography. Atlases.

Eclectic Historical Atlas and Charts. N. Y.

**Freeman, E. A. *Historical Geography of Europe.* Lond. 1882. 2 vols. (Second vol. maps.)

Johnston, W. and A. K. *Historical Atlas.* Edin. 1880. 2 vols.

Labberton, R. H. *Historical Atlas and General History.* N. Y. 1888.

Spruner, K. von. *Historico-Geographical Hand Atlas.* Gotha, 1872. (In English.)

Language.

*Clark, J. *Manual of Linguistics.* N. Y. 1893.

*Giles, P. *Manual of Comparative Philology.* Lond. 1895.

Hoffman, W. J. *Beginnings of Writing.* Lond. 1894. (Anthrop. Ser.)

Hovelague, A. *Science of Language: Linguistics, Philology, Etymology.* Phil. 1877. (Libr. Contemp. Sci.)

Müller, F. M. *Lectures on the Science of Language.* N. Y. 1865.

**Sayce, A. H. *Introduction to the Science of Language.* Lond. 1890. 2 vols.

*Whitney, W. D. *Language and the Study of Language.* N. Y. 1894.

Literature.

*Botta, A. C. *Handbook of Universal Literature.* Bost. 1885.

Schlegel, F. *Lectures on the History of Literature, Ancient and Modern.* Lond. 1868.

Taylor, I. *History of the Transmission of Ancient Books to Modern Times.* Lond. 1859.

Philosophy.

*Lewis, G. H. *Biographical History of Philosophy.* N. Y. 1873.

Schwegler, A. *History of Philosophy in Epitome.* N. Y. 1882.

**Ueberweg, F. *History of Philosophy.* N. Y. 1872. 2 vols.

Physical geography.

Guyot, A. *Earth and Man: Comparative Physical Geography in its Relation to the History of Mankind.* Bost. 1870.

Hinman, R. *Eclectic Physical Geography.* N. Y. 1888.

- *Mill, H. R. *Realm of Nature: An Outline of Physiography.* N. Y. 1892.
 Ritter, C. *Comparative Geography.* N. Y. 1865.

Religion.

- Caird, E. *Evolution of Religion.* N. Y. 1893. 2 vols.
 *Clarke, J. F. *Ten Great Religions.* Bost. 1894. 2 vols.
 Clodd, E. *Childhood of Religion.* N. Y. 1890.
 Gould, S. Baring-. *Origin and Development of Religious Belief.* Lond. 1892. 2 vols.
 Tiele, C. P. *Outlines of the History of Religion.* Lond. 1888.

II. ANCIENT AND ORIENTAL COUNTRIES

Ancient History, General.

- Dunker, M. W. *History of Antiquity.* Lond. 1877. 6 vols.
 *Rawlinson, G. *Manual of Ancient History.* N. Y. 1880.
 Smith, P. *History of the Ancient World.* Lond. 1873. 3 vols.

Oriental History, General.

- Lenormant, F., and Chevallier, E. *Manual of the Ancient History of the East.* N. Y. 1875. 2 vols.
 Ragozin, Z. *Story of Chaldaea. Story of Assyria. Story of Media, Babylon, and Persia.* N. Y. 3 vols. (Story of the Nations.)
 **Rawlinson, G. *Five Great Monarchies of the Ancient World.* (Chaldaea, Assyria, Babylon, Media, and Persia.) N. Y. 1870. 3 vols.
 ——— *Sixth Great Oriental Monarchy.* (Parthia.) N. Y. 1872.
 ——— *Seventh Great Oriental Monarchy.* (New Persian empire.) N. Y. 1882.
 *Sayce, A. H. *Ancient Empires of the East.* N. Y. 1889.
 *Smith, P. *Student's Ancient History of the East.* N. Y. 1871. (Student's Ser.)

SPECIAL TOPICS

China.

- Boulger, D. C. v. K. *History of China.* Lond. 1881. 3 vols.
